cGMP Compliance Design Requirements

3rd International Summit on

GMP, GCP & Quality Control

September 25-26, 2014 Valencia, Spain

Of Sterile/Aseptic Manufacturing Facilities

**cGMP compliance design of
Sterile/Aseptic Manufacturing Facilities
is a mandatory to meet qualification
and validation requirements**

HEALTH CANADA EXPERT

SUMMARY

1. CGMP regulation requirements
2. Reminder of URS / Clean Rooms
3. Design of clean rooms
4. Types of contaminants
5. Gowning & means of prevention
6. Classifications of rooms vs standards & applications
7. Types of segregation, of flow, of cascades
8. Building construction and architectural finishes
9. Design of HVAC systems for sterile products
10. Design in the presence of High Potent products
11. PPE, Personal Protective equipment
12. Elements of Commissioning/Validation of Premises & HVAC
13. Many case studies will be presented

WHY STERILE FACILITIES HAVE TO MEET cGMP REQUIREMENT?

www.globalcompliancepanel.com

RiskMgmtOvView

Why Risk Management?

- About 45% of the recalls of drugs and devices are due to design problems.
 - Many of the design problems create risks.
 - Many design risks are ignored by fools who think that only positive thoughts are permissible.
- You cannot rely on operator effectiveness.
 - The more you rely on operators the greater the chance of problems as operators are never 100% effective.
 - Even robots have breakdowns or software glitches.
- You cannot assume that patients will follow directions.

cGMP
Regulatory
Requirements?

Basic GMP Requirements -URS

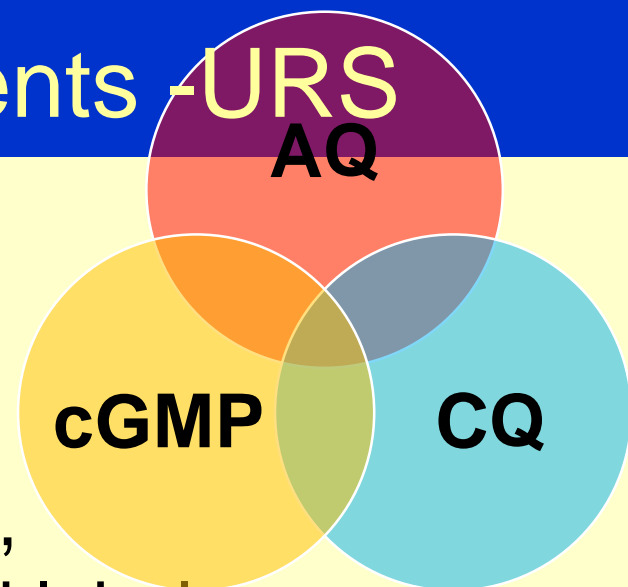

1. **Manufacturing processes** are clearly defined and controlled to ensure consistency and compliance with approved specifications;
2. **Critical steps** of manufacturing processes and significant changes to the process are **validated**;

Basic GMP Requirements - URS

3. **Critical GMP requirements :**

- **Qualified** and trained **personnel**,
- **Adequate** premises and **space**,
- Suitable **equipment** and services,
- Correct **materials**, containers and labels,
- Approved **procedures** and instructions,
- Suitable **storage** and transport.

Health Canada / Health Products and Food Branch Inspectorate

Good Manufacturing Practices Guidelines (GMP) 2009 Edition / November 8, 2009

CANADA: 1.514.616.2692 • TUNISIE: 216.96.751.330 • MAROC: 212.622.629.224 • ALGÉRIE: 213.561.234.333

 **PBE, VOTRE PARTENAIRE EN CONFORMITÉ ET EN INGÉNIERIE RÉGLEMENTAIRE**

How to maintain the air quality in CR

► By **controlling** the **contaminants**, according:

Three rules:

- a. CE
- b. CT
- c. LEV

LEV : Local Exhaust Ventilation

pbe@pharmabioeng.com • www.pharmabioeng.com

CANADA: 1.514.616.2692 • TUNISIE: 216.96.751.330 • MAROC: 212.622.629.224 • ALGÉRIE: 213.561.234.333

PBE, VOTRE PARTENAIRE EN CONFORMITÉ ET EN INGÉNIERIE RÉGLEMENTAIRE

How to maintain the air quality in CR

▶ **Control of the contaminants :**

1- ▶ by monitoring **the pressure cascade** between the adjacent production areas,

2- ▶ by checking and replacing periodically the air filters

(HEPA: Integrity Test).

pbe@pharmabioeng.com • www.pharmabioeng.com

CANADA: 1.514.616.2692 • TUNISIE: 216.96.751.330 • MAROC: 212.622.629.224 • ALGÉRIE: 213.561.234.333

PBE, VOTRE PARTENAIRE EN CONFORMITÉ ET EN INGÉNIERIE RÉGLEMENTAIRE

How to maintain the air quality in CR

→ by suitable **HVAC** designed taking into account:

- ▶ Uni Directional Air Flow : **UDAF** or **NUDAF**
- ▶ **HEPA** Filters (Terminal or Central, Integrity Test)
- ▶ Air velocity or **ACR**, (Volumetric Flow)
- ▶ Related **VNV** CR / Air Classification (ISO14644 / cGMP)
- ▶ Appropriate **Gowning** & **Flows** (Personal, Material & Products)
- ▶ Physical & Mechanical Segregations & **Barriers**

Contaminant & Their Removal Technology

TYPE OF CONTAMINANT	EXAMPLE	DERIVED FROM: (Examples)	DEALT WITH BY: (Examples)
Non-viable (particulates)	<ul style="list-style-type: none"> - Metal specks - Clothing fiber 	<ul style="list-style-type: none"> - Equipment - People's clothing - Outside air - Water supply 	<ul style="list-style-type: none"> - Airborne particles are HEPA filtered - Contact parts are cleaned and sterilized. - Water purification systems
Viable (micro-organism)	<ul style="list-style-type: none"> - Bacteria - Yeast molds 	<ul style="list-style-type: none"> - People - Water - Outside air - Equipment, tools - Excipients, active ingredients 	<ul style="list-style-type: none"> - Limit aseptic core interventions - Airborne particles are HEPA filtered - Sterile filtration of solutions (0.2µm) - Steam sterilization or irradiation of components
Endotoxins (Not normally associated with airborne bacteria)	<ul style="list-style-type: none"> - Arising from cell wall debris from certain organisms (often water borne) 	<ul style="list-style-type: none"> - Wet equipment change parts, or container/closure after a period of time exposure 	<ul style="list-style-type: none"> - Caustic soda solution with heat - High temperature (>200°C) time dependent

Means of Prevention / Design of rooms

✓ Segregation and flow :

1. Primary Segregation:

□ Physical Design of the unit of production:

- PAL & MAL,
- Corridors,
- Access Cards,
- Dedicated rooms,
- HVAC,
- Protection Systems,
- Clean Utilities.

Figure 8.6: Airlock Configurations

2. Secondary Segregation :

□ Procedures for controls to reduce the risk of contamination and cross-contamination

Gowning-Classification Rooms

ISPE vol. 3-p20

Terminology for Air Quality used in this Guide	Typical Area	Example of dress code
External	Street, Restaurant	Outdoor clothes
Unclassified	Laboratories, Offices, Warehouse	Appropriate to area
Pharmaceutical	Packing Hall	Captive coat, hat and overshoes
Class 100,000 (in operation)	Non-sterile processing	Clean garments
Class 10,000 (in operation)	Room where filling takes place	Sterile garments
Class 100 (in operation)	Point of fill or other aseptic manipulations	Sterile garments

pbe@pharmabioeng.com • www.pharmabioeng.com

CANADA: 1.514.616.2692 • TUNISIE: 216.96.751.330 • MAROC: 212.622.629.224 • ALGÉRIE: 213.561.234.333

Major contamination vectors

1. Raw materials (powder, HP, biological material, aerosols)
2. Equipment
3. Personnel (skin and hair)
4. Environment (surface, air)
5. Utilities, (Steam, compressed air, water...)

pbe@pharmabioeng.com • www.pharmabioeng.com

CANADA: 1.514.616.2692 • TUNISIE: 216.96.751.330 • MAROC: 212.622.629.224 • ALGÉRIE: 213.561.234.333

Number of particles > 0.5 µm released/mn

Activity ?

Number of particles released by Clothing

Volume of occupied space equals 36ft^3 minus the volume of the operator = 18ft^3

Starting condition assume Class 100.

Therefore, space contains 1800 particles at $0.5\mu\text{m}$

Generation rate taken as $P = 1 \times 10^4$ $0.5\mu\text{m}$ particles per sec.

After 18secs 180,000 particles are released that takes the contained volume over class 10,000.

After 3mins 1,800,000 particles are released that exceeds Class 100,000 within the occupied space.

TABLE 1- Air Classifications^a

Clean Area Classification (0.5 um particles/ft ³)	ISO Designation ^b	≥ 0.5 μm particles/m ³	Microbiological Active Air Action Levels ^c (cfu/m ³)	Microbiological Settling Plates Action Levels ^c (diam. 90mm; cfu/4 hours)
100	5	3,520	1 ^e	1 ^e
1000	6	35,200	7	3
10,000	7	352,000	10	5
100,000	8	3,520,000	100	50

a- All classifications based on data measured in the vicinity of exposed materials/articles during periods of activity.

b- ISO 14644-1 designations provide uniform particle concentration values for cleanrooms in multiple industries. An ISO 5 particle concentration is equal to Class 100 and approximately equals EU Grade A.

c- Values represent recommended levels of environmental quality. You may find it appropriate to establish alternate microbiological action levels due to the nature of the operation or method of analysis.

d- The additional use of settling plates is optional.

e- Samples from Class 100 (ISO 5) environments should normally yield no microbiological contaminants.

Clean Area Classification - (Non-Viable) ANSM 04/12/2013

GMP/ **ANSM** -14. The particulate limits indicated in the table " **AT REST** " must be reached after a short time of purification of **15 to 20 minutes** (guide value)

Means of prevention / design of rooms

✓ Segregation and flow :

1. Primary Segregation :

□ Physical Design of the manufacturing plant:

- PAL & PAL airlocks,
- Corridors,
- Access Cards,
- Dedicated manufacturing rooms,
- HVAC,
- Protection Systems,
- Clean Utilities

2. Secondary Segregation :

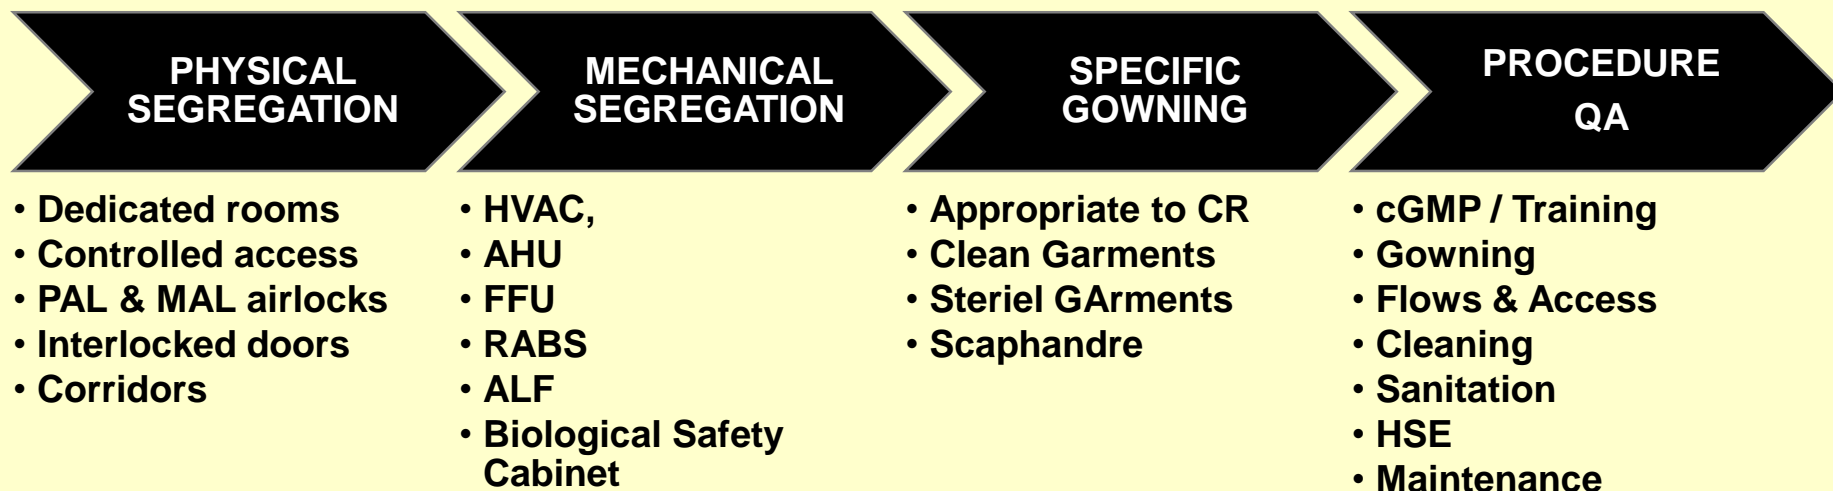

□ Procedures for controls to reduce the risk of contamination and cross-contamination

Facility Design & Prevention Technologies

2.3 → Manufacturing areas are separated from non-manufacturing areas. (Attention to **SUSPENDED CEILING**!)

→ **Segregation** :

→ They are clearly defined and isolated.

Air supply system Capacity (HVAC)

The sizing of the HVAC unit (its Cost \$\$\$) will depend :

1. Internal contaminant loads
2. Dissipated heat by the equipment
3. Number of working personnel
4. Cleanroom air classification
5. Type of filtration (HEPA)
6. Loses of the pressure on the Filters
7. Hourly ACR : air change rate
8. Temperature & RH% difference between Fresh air and CR.

pbe@pharmabioeng.com • www.pharmabioeng.com

CANADA: 1.514.616.2692 • TUNISIE: 216.96.751.330 • MAROC: 212.622.629.224 • ALGÉRIE: 213.561.234.333

$$Cr_{Rest} = (Initial\ Cr - C_s) \exp(-N \cdot t) + C_s$$

RECOVERY TIME of the air quality ISPE, ISO-14644-3 (B12)

Recovery Time (mn)	ISO8/D @ ISO7/C	ISO7/C @ ISO 5/A	ISO8/D @ ISO 5/A
ACR10			
ACR20	7	14	21
ACR30			
ACR40			
ACR60			
ACR120			
ACR240			

Recovery Time of the Air Quality ISPE, ISO-14644-3 (B12)

The " **clean-up** " or " **recovery** " test should demonstrate a change in particle **concentration** by a factor of **10 to 100** Within the prescribed time.
 (WHO, Annex 4, Sterile)
 (ISO 14644-3 clause B. 12)

Maximum permitted airborne particle concentration

Grade	Maximum permitted number of particles per m ³ greater than or equal to the tabulated size			
	At rest ^a		In operation ^b	
	0.5 μm	5.0 μm	0.5 μm	5.0 μm
A	3 520	20	3 520	20
B	3 520	29	352 000	2 900
C	352 000	2 900	3 520 000	29 000
D	3 520 000	29 000	Not defined	Not defined

^a The “at rest” state is the condition where the installation is complete with equipment installed and operating in a manner agreed upon by the customer and supplier, but with no personnel present.

^b The “in operation” state is the condition where the installation is functioning in the defined operating mode and the specified number of personnel is present. The areas and their associated environmental control systems should be designed to achieve both the “at rest” and “in operation” states.

HVAC Design vs Level Protection & Classification / ISPE

Level	Condition	Example of area
Level 1	General	Area with normal housekeeping and maintenance where there is no potential for product contamination, e.g. warehousing.
Level 2	Protected	Area in which steps are taken to protect the pharmaceutical starting material gold product from direct or indirect contamination or degradation, e.g. secondary packing, warehousing, first stage changed rooms.
Level 3	Controlled	Area in which specific environmental conditions are defined, controlled and monitored to prevent contamination or degradation of the pharmaceutical starting material gold product, e.g. where product, starting materials and components are exposed to the room environment; more equipment wash and storage areas for equipment product contact parts.

Levels of protection and recommended filtration / ISPE

Level of Protection	Recommended Filtration
Level 1	Primary filters only (e.g. IN 779 G4 filters)
Level 2	Protected areas operating on 100% outside air: primary more Secondary filters (e.g. IN 779 G4 more F8 or F9 filters)
Level 3	Production facility operating it recirculated more ambient Air, where potential for cross-contamination exists: Primary plus secondary more tertiary filters (e.g. IN 779 G4 more F8 more 1822 H13 filters) for full fresh air system , without Recirculation, G4 and F8 or F9 filters are acceptable)

Note: The filter classifications shall be referred to above relate to the 1822 and in 779 test standards (IN 779 recounted to filter classes G1 to F9 and 1822 recounted to filter classes E10 to U17). Refer to Figure 8 for comparative classifications of other filter standards.

ABSOLUTE HEPA FILTERS

Standards

Two standards govern the filters:

- • **1822**: this standard deals with testing of performance of the filters to very high efficiency (HEPA) and very low penetration (ULPA)

Note:

The value of **the overall MPPS efficiency** is the one being searched for the qualification tests .

MPPS : Most Penetrative Particle Size

HVAC Components Design

22. Supply diffusers :

- By induction
- By perforated plate

Elements of HVAC design - WHO - TRS-929 (Annex 3)

- ✓ 4.2.9 Supply air **DIFFUSERS** of the high **INDUCTION type** (e.g. those typically used for office-type air-conditioning) should where possible **not be used in clean areas** where dust is liberated.
- ✓ **Air diffusers should be of the non-induction type**, introducing air with the least amount of induction so as to maximize the flushing effect

✓ Fig. 4.8 (WHO-
Working document
QAS/02,048 /Rev. 1)

**Induction diffuser
(Not recommended)**

✓ Fig. 4.9 (WHO-
Working document
QAS/02,048 /Rev. 1)

**Perforated plate
diffuser
(Recommended)**
