

Title: Platelet Rich Fibrin(P.R.F) for Skin Rejuvenation

Name: Cristiano Bellico de Paiva
CEO ,Instituto Sinergy School , Brazil

Platelet rich fibrin (PRF) is a fibrin matrix in which platelet cytokines, growth factors, and cells are trapped and may be released after a certain time and that can serve as a resorbable membrane. Choukroun and his associates were amongst the pioneers for using PRF protocol in oral and maxillofacial surgery to improve bone healing in implant dentistry. Autologous PRF is considered to be a healing biomaterial, and presently, studies have shown its application in various disciplines of dentistry and skin rejuvenation. Tissue engineering has emerged at the intersection of numerous disciplines to meet a global clinical need for technologies to promote the regeneration of tissues.

In this presentation , we discuss the use of PRF in Skin Rejuvenation and its applicability in facial aesthetics. He will show some techniques for melasmas, acne scars, filling the nasogenian fold, temples and dark circles besides the use to improve the aged look of facial skin.

Biography

Dr Paiva is a Doctor of Dental Surgery, specialized in Implatology, Forensic Dentist and Prosthetic Dentist.

He has also a course in oral microsurgery, laser therapy, MBA in Marketing and several courses in the area of facial aesthetics.

A few years ago he started studying aesthetics and facial function, with the concept of Orofacial harmonization. The intention was to provide the best for his patients because quite often when finishing a complete oral rehabilitation, he could notice the disharmony between the facial structures of the maxillofacial complex.

With this new philosophy of work, he began to incorporate esthetic treatments of facial rejuvenation in his clinic. He uses in his daily routine hyaluronic acid, PDO wires (polydoxynone), Botulinum Toxin, and Platelet Rich Fibrin.

He developed the approach called 5 steps concept, which is a globalized concept of facial rejuvenation.
