Botox Therapy in Dentistry.

Dental therapies have advanced over the decades, but we still seem to be across major dental issues that do not seem to have the prefect cure. Bruxism, tmj disorders, trismus, migraine are some of the examples that are still in the race for the best treatment alternative. To treat these conditions that do not respond to the convention methods of cure Botulinum toxins were introduced. Although a poison, it does have various benefits to upgrade the methods of pain relief in dentistry. It works by traversing to the cholinergic nerve endings and blocking acetylcholine release thereby inhibiting the conduction of pain.
