PRP ,orgasm (O)- shot in menopausal women for related sexual dysfunctions.

Dr Maha Sorour MD.Cairo university

Statement of problem: Many women who have passed their childbearing years believe they have to live with vaginal dryness .they may find sexual intercourse painful but think it is normal .,and many give up on ever getting relief. This leaves them frustrated,and their partners are not very happy either about their lack of interest in sex.the prp orgasm shot specially designed for women who experience any of the many side effects that come with female sexual dysfunction ,prp has been demonstrated to be effective with no serious side effects and activates pluripotent cells in the area of injection resulting in rejuvenation .since PRP is autologous , there's are no known contraindications and also offers the advantage of flowing into tissues . There are several growth factors and cytokines in the platelets that are released to cellular damage starting to work together stimulating process of fibroblast collagen synthesis. Methodology&theoretical orientation:the o-shot is non-surgical procedure. The entire treatment process is virtually painless.to start ,we will draw a small amount of blood to create the prp that will be injected into the vagina . A strong numbing ointment will be applied to the vaginal opening,the anterior wall,and the clitoris. And then inject these specific areas with prp . Findings: we can expect to experience results quickly ,often within days of the orgasm shot,and results continue to increase with time as body generates new healthier tissue.

Conclusion &significance :improvement typically lasts between 1 to 2 years,with some individuals results lasting even longer. Most women can see a significant improvement after just one injection , the o-shot can provide a lot of benefits include better sex,stronger libido ,increased sensation,decrease pain during intercourse , more natural lubrication ,orgasms become stronger and more frequent Recommendations :prp is safe non surgical procedure especially for women go into procedure with realistic expectations are more likely to be happy with results.
