Some of my hypothysis on Human Behavioral Neurogenetics:

1."If you want to judge a particular phenotype genetical act of 2nd individual,you will have to set yourself(Without being the information of that particular genticalact)just over the 2nd individual's genetics organ(Which is responsiblefor that particular genetical act).But if you are somehow involve or become the information of that act of 2nd individual, you will not be able to judge or predict Genetical act (throughly) of the 2nd individual " This is the theory of unprediction(The Genetical version of theory of uncertainty of Modern Physics).

2.Strongest acts of Human being as stayed numeric orders-1.Sex(First strongest act)2.True Love(Second strongest act)3.Anger(Third strongrst act)

3.A mental patient's drug zone will be the most active part of his brain.

4.How the information from an outside factors come into brain and how genetics code process that and react accordingly?

5.What is automatic repeat of Genetical act?

6.Basic EF(External Factors)Relish,Sound,light etc have different geometric Figure which affect the genetical Codes(A,T,C,G)differently and thus Genetics make different acts.
