MARKET ANALYSIS

The surgical management of disorders involving the nervous system, including the brain, spine, and nerves, is the focus of the medical speciality known as neurosurgery. It is a discipline that is developing quickly, with new tools and methods appearing that are enhancing patient results and extending the variety of ailments that can be surgically treated.

The use of minimally invasive procedures in neurosurgery is one trend that is anticipated to persist until 2023 and beyond. Small incisions and specialised equipment are used during minimally invasive surgery, also known as keyhole surgery, which can result in shorter recovery times, less discomfort, and fewer complications than conventional open surgery.

The need for minimally invasive neurosurgical tools and equipment, including endoscopes, surgical robots, and navigation systems, is anticipated to increase as a result of this trend.

The ageing population is another factor that will probably have an effect on the neurosurgery industry in 2023. The prevalence of diseases like brain tumours, spinal stenosis, and other degenerative spine ailments is anticipated to rise as the population ages. This can result in a rise in demand for tools and services related to neurosurgery.
