WHAT IS THE OUTCOME FOR MARINE TURTLECONSERVATION FACE TO CLIMATE CHANGE?

COULD THE DANGER BE AVOIDED?

Climate change has become the cross-cutting issue, the challenge to conservation activities. For several years we have been working on the conservation of marine ecosystems, especially with sea turtles as an emblematic species. Today the activities of conservation on the beaches are hindered by the disappearance of certain beaches. Thus, we will present in the form of a poster the results of monitoring activities of nesting sea turtles over 10 years from 2000 to 2010. Compared to the work done between 2011 to 2016 affected by the disappearance of beaches due to the rise of the oceans. This makes it difficult to collect data. In this work, we will discuss the results and the difficulties we face. Then some solutions.
