Maximizing Aesthetics on Single Implants

The beauty in implant dentistry is that every case is an individual challenge. An ideal implant treatment uses procedures, techniques, materials and technologies that leads fast and on the shortest way to a maximally aesthetic result. The main goal is to achieve osseointegration and aesthetics in order to get long term stability. For this we need to obtain both, bone formation and gum thickness, as any failure in one of the 2 factors, will induce the loss of the second factor. The purposes of this presentation is to show participants the tissue stabilization factors and to demonstrate how to achieve the planned results at a single tooth replacement.
