Dr Oded Lerman

ABSTRACT

IMMEDIATE LOADING – MAKE IT SIMPLE

Immediate loading is known from the 1960 s by Branemark and Linkowh

Based on the OSSEOINTGRATION process described by Branemark

In 1976 Schulte show a good survival rate for immediate loaded implant following extraction

The restoration on top of the immediate loaded implant is based on the MECHANOSTAT theory described by FROST using the remodeling phenomena

By splinting the implants during the restoration process

Immediate loading following extractions is used in the last decade

It is considered as more difficult technique than the delayed approach

In my lecture I share my long experience with immediate loading following extraction full mouth rehabilitation

I describe the osseointegration and remodeling process step by step in short emphasizing the critical moment in correlation with the restoration process

In order to give the audience practical information 20 of my cases are presented describing a simple approach to full mouth rehabilitation using the immediate loading following extraction protocol

The lecture takes 30-45 min.
