Abstract

The Production Services Platform (PSP) Tool integrates innovative sensors and technology to increase the efficiency, reliability, and accuracy of real-time production logging in wells at any angle, from vertical to horizontal. The result is three-phase flow profiles, gas and liquid holdups, and directional fluid velocity measurements for confident, comprehensive characterization of your down holes flow regime. In this paper, Production Services Platform (PSP) Tool and its applications for an oil well in oil reservoir has been discussed.
