Abstract *: Multiseptate Gallbladder are rare congenital abnormality, only few cases have been reported world wide. These Gallbladders have transversely oriented septa, with or without Gallstones. Most patients present with Recurrent billiard colic pain, radiologically USS abdomen were compatible in picking up the anomaly pattern of multiple separations, giving it wrinkled or honeycomb appearance. Patients who are symptomatic with colic pain benefit from Laparascopic Cholecystectomy.*
We discuss a case of an 18 year female who has been complaining of right upper quadrant pain for past 12 months, normal liver functions was diagnosed with Multiseptate Gallbladder on USS abdomen. She recently had an Laparoscopic Cholecystectomy, IOC cannulation failed due to small fibrotic cystic duct. Post operatively she had resolution of symptoms.
