Abstract

In the psych of a human being in interaction of the other is neural connections that help you as a person benefit from the encountering. A physical contact, a thoughtful expression, and emotional gesture is all a play in the part off interaction that gets to the psych. Through the pupil, inertia is seen from movement in difference with background. That is how the eye processes verbosity with the rods and cones calculating difference in depth of colour in the image you see processed as picture within the brain of your medulla oblongata. The photon being processed as photo. Each radiated subdivision of the photo is experienced as video and that is movement of animated thought.

Keywords: Interaction; Neural; Physical; Psych

Introduction

The psych consists of a physical integration that differentiates between thought and reaction. Integration to see the area of verbal reaction and differentiation of the actioned response effect. In combination, psych animated interaction. That is, the psych explained in writing. Why I say this is because you cannot explain your own fathom in thought of psych without physical writing because anything else will be part of the interaction. The mind then plays a trick on your brain like a thought realm game to see who would win if you had the best reactions. That's when peer pressure kicks in and all experienced is societies thought on your behaviour. A loss in this game would cause deep ramifications due to the interaction explained before due to loss of your confidence, the societal response in that nervous breakdown becoming ostracism due to adaptation of survival instinct. Hence, prison systems and jails for personalities of misbehaviour.

Results

The psychology of interaction is the very fathom of thought you think as pressure when society kicks in and you have to obide by the regulation set in thought of the dynamic equilibrium in survival of mutated niches in habitats of adaptable environment conditional influences. Thus, differences in political, social, and psychological systems in habitats of settlement around the world. Tradition.

Thank you, Dr. Karabo Motswagae.
