# Scientific Program

Euro Nephrology 2018

# DAY-1

October 15, 2018

Meeting Hall: Belweder II

## Opening Ceremony ..... 10:00-10:25

## KEYNOTE FORUM

**10:25-10:30** Introduction

**10:30-11:15** Title: Early alterations in diabetic nephropathy
**Jose L Reyes,** National Polytechnic Institute, Mexico

**11:15-12:00** Title: Anti-human leukocyte antigen antibody analysis in kidney transplant recipients
**Andrew L Lobashevsky,** Indiana University Health, USA

## GROUP PHOTO

Networking & Refreshments 12:00-12:15 @ Foyer

## SPEAKER FORUM

Sessions: Nephrology | Kidney Transplantation | Glomerular Disorders | Renal Pathology-Immunology | Kidney Diseases

Chair: **Jose L Reyes,** National Polytechnic Institute, Mexico
Co-Chair: **Andrew L Lobashevsky,** Indiana University Health, USA

## INTRODUCTION

**12:15-12:45** Title: Efficacy and safety of etelcalcetide in patients receiving hemodialysis with secondary hyperparathyroidism: Real life data
**Ioannis Griveas,** NEFROIATRIKI Ltd., Greece

**12:45-13:15** Title: Folic acid induced acute kidney injury and recovery: Using HK2 cells as experimental model
**Yihe Li,** University of Nottingham, UK

Lunch Break 13:15-14:15 @ Restaurant Marysienka

**14:15-14:45** Title: The renal replacement therapy in critically ill patients: Practical approaches in specific situations based on case reports
**Nadezda Petejova,** University of Ostrava, Czech Republic

**14:45-15:15** Title: Managing urethral strictures using cooks S-curve dilator: Is it economical as an outpatient procedure?
**Ahmed Omer Yousif,** University of Liverpool, UK

Networking & Refreshments 15:15-15:30 @ Foyer

POSTER PRESENTATIONS @ 15:30-15:50

Panel Discussion

Awards & Closing Ceremony

# DAY-2

October 16, 2018

Extended Networking & Lunch @ 12:30-13:30

## Impact Factor Calculation:

Impact Factor was established by dividing the number of articles published in 2012 and 2013 with the number of times they are cited in 2014 based on Google search and the Scholar Citation Index database. If 'X' is the total number of articles published in 2012 and 2013, and 'Y' is the number of times these articles were cited in indexed journals during 2014 than, impact factor = Y/X

## Early alterations in diabetic nephropathy

Diabetes is one of the main causes of renal failure all over the world. The mechanisms initiating diabetic nephropathy have been only partially studied. We analyzed the damage induced by diabetes on the intercellular renal junctions since information on this issue is relevant. Glucose is filtered in the kidney at the glomeruli and is reabsorbed at the proximal tubule. In the absorption of glucose participates SGLT1 and 2, located at the apical brush border and GLUT1 and 2, located at the basolateral membrane of the proximal tubular cells. We explored differentially alterations in the glomeruli, the proximal tubule and the distal tubule. We found extensive decrease and damage in claudin 5, protein located at the glomerular capillaries and in claudin 2, intercellular protein of the proximal tubule. In distal tubules we found increment in claudins 4 and 8, but not delocalization of these proteins. These lesions were observed in the presence of oxidative stress which has been also described in the diabetic patient. The glomerular and the proximal tubular damage were ameliorated by the prevention of oxidative stress.

## Anti-human leukocyte antigen antibody analysis in kidney transplant recipients

Donor human leukocyte antigen (HLA)-specific antibodies (DSA) play an important role in solid organ transplantation. Preexisting IgG isotype DSA are considered a risk factor for antibody mediated rejection, graft failure or graft loss. The post-transplant development of DSA depends on multiple factors including immunogenicity of mismatched antigens, HLA class II typing of the recipient, cytokine gene polymorphisms, and cellular immunoregulatory mechanisms. Interaction between complementarity determining regions of the antibody and HLA can be detected by mean fluorescence intensity or lysis of cell membrane through activation of complement. These biological functions of alloantibodies strictly depend on amino acid residue composition of functional and structural epitopes of the antigen. *De novo* developed antibodies require special attention because not all DSA have equal clinical significance. Therefore, it is important for transplant clinicians and transplant immunologists to accurately characterize DSA. In this talk the contemporary immunological techniques for detection and characterization of anti-HLA antibodies and their pitfalls are presented.

## Efficacy and safety of etelcalcetide in patients receiving hemodialysis with secondary hyperparathyroidism: Real life data

**Ioannis Griveas, M Aktsiali, C Andriopoulos** and **P Sitaras**
NEFROIATRIKI Ltd., Greece

Secondary hyperparathyroidism (SHPT), complication of chronic kidney disease, is characterized by disturbances in mineral metabolism. Calcium-sensing receptor (CaSR) is the main physiological regulator of parathyroid hormone (PTH) secreation. We tried to evaluate efficacy and safety of etelcalcetide, a new IV calcimimetic in our hemodialysis (HD) population. We prospectively followed 60 HD patients for a six month period. The primary endpoint of the study was the proportion of patients with serum intact parathyroid hormone (iPTH) between 200-350 pg/ml until the end of the study period. The following parameters were determined as secondary efficacy endpoints: Measured and percent changes from baseline in serum iPTH, Ca, pH, Alb, Hct, Hb, SAP, cardiac function at each time point. The safety and tolerability profiles of etelcalcetide were assessed based on AEs (advanced encryption standard). After a month of treatment with etelcalcetide, PTH reduced significantly from 823 pg/mL to 654.8 pg/mL ($p<0.05$). pH levels were also significantly reduced from 7.28 to 5.04 mg/dl ($p<0.05$). Ca levels remained stable after a week of therapy (from 8.68 mg/dl to 8.61 mg/dl, p=NS). In five patients Ca levels were below 7.5 mg/dl. In three of them Ca levels returned to baseline after a month, in one dose of etelcalcetide reduced, and one had to stop medication temporarily. None of our patients had GI adverse effects. After 2 months notification, the new second-generation calcimimetic etelcalcetide effectively reduces PTH, pH with an acceptable safety profile. Hopefully at the end of our study protocol we will reach to more solid conclusions regarding better control of SHPT.

## Folic acid induced acute kidney injury and recovery: Using HK2 cells as experimental model

**Yihe Li** and **Simon Wilham**
The University of Nottingham, UK

Folic acid-induced kidney injury has similar syndromes as human acute kidney injury, it is considered as an experimental model for evaluation of epithelial regeneration and interstitial fibrosis. We intended to make use of human proximal tubule cells (HK2) to test the damage and recovery after treating cells with folic acid (FA). HK2 cells were seeded in 96-well plates and incubated with FA (10 mM, 14 mM, 18 mM and 23 mM) in fetal bovine serum (FBS)-free Dulbecco's Modified Eagle's medium (DMEM) for 24 hours or 48 hours. Cells were then allowed to recover in DMEM with 10% FBS for up to 120 hours. MTT assays were performed and cell viability was calculated as percentage to non-treated cells. Cell viability was affected by both dose-dependent and time-dependent manners. It had a significantly decrease for 24 hours FA treatment at 18 mM and 23 mM ($p<0.05$). This pattern was similarly observed for 48 hours treatment. Cell viability was significantly decreased at 18 mM, 23 mM FA treated cells by massively 80% and 90% respectively after 48 hours incubation ($p<0.05$). During recovery, cell viability of 24 hours treated cells showed no significant difference to those of control after 48 hours recovery, and cell viability of 48 hours treated cells showed no significant difference to those of control after 72 hours recovery. To conclude, HK2 cells were able to respond to injury induced by FA in dose and time dependent pattern, and HK2 cells were capable to recover after injury.

## The renal replacement therapy in critically ill patients: Practical approaches in specific situations based on case reports

**Nadezda Petejova**
University of Ostrava, Czech Republic

Acute kidney injury (AKI) is a common diagnosis in daily clinical practice, occurring in virtually all fields of medicine. Critically ill patients are especially prone to the development of AKI due to frequent hemodynamic instability, multiple risk factors and, diagnostic and/or treatment complications. For these and other reasons, critical care nephrology plays an irreplaceable role in treating critically ill patients in ICUs. The aim is to present overview using relevant scientific research results, along with the authors own practical clinical experience with renal replacement therapy (RRT) in specific clinical situations (case reports) from the University Hospital of Ostrava in the Czech Republic. Treatment of AKI associated with rhabdomyolysis in patient with abdominal aortic aneurysm and ischemia-reperfusion syndrome. Efficacy of plasmapheresis for hypertriglyceridemia induced acute pancreatitis in pregnancy associated with abdominal compartment syndrome and the practical use of hemoperfusion with Cytosorb in patients suffered from sepsis and multiple organ dysfunction syndromes. Many issues can be expected in these specific situations including complications and benefits of treatment. Knowledge of the indications, existing data on the actual results of and not least, the complications of extracorporeal blood purification techniques, provide a perspective for the clinician.

## Managing urethral strictures using Cook S-curve dilator: Is it economical as an outpatient procedure?

**Ahmed Omer Yousif**
University of Liverpool, UK

**Background:** Urethral strictures contribute to 17,000 admissions and 12,000 operations yearly with an estimated cost over 10 million in the UK. Current management techniques all involve general anesthetic thus leading to prolonged hospital stay and an increase in NHS resources. A new technique allowing urethral strictures to be managed as an outpatient basis using an instrument called an S curve dilator has been developed.

**Aim:** The primary objective is to assess whether utilizing the S-curve dilator technique was more economical than other techniques employed and secondary objective is to assess the aetiology behind urethral strictures and therefore allow steps to reduce them.

**Methodology:** This was a retrospective study that looked at all the urethral strictures that were treated using S–curve dilators between 23/06/2015 till 03/08/2016. All the S-curve dilator technique operations were performed by one trained consultant over that time period. The study was set in a 400–bed district general hospital covering a population of 731,500 where this technique has recently been utilized since 2015.

**Results:** The national average cost of treating urethral strictures using the S curve dilators is £363 as compared to £1559 as an elective procedure using other procedures requiring general anesthetic. The most common aetiology underlying urethral strictures is iatrogenic damage following trans-urethral resection of the prostate (TURP) operations.

**Conclusion:** The new S Cook dilators allow urethral strictures to be managed as an outpatient procedure, thus; reducing theatre waiting lists, reduced inpatient stay and reduced cost (3 times cheaper). Furthermore, it offers advantages over blind procedures in that there are no false passages and there is reduced risk of damage and failure. Urethral strictures most commonly occur following TURP operations which could be related to urinary catheters being left in too long prior to the operation.

**Recommendations:** Continue using S-curve dilators and train more urologists/ nurses to do them; ensure catheters are not left for too long whilst awaiting TURP operations and perform a qualitative study regarding patient satisfaction and experience with urethral stricture operations using S-curve dilators.

**Limitations:** The main limitation was the small sample size and the lack of literature on S Cook dilators.

## Urate-lowering therapy ameliorates kidney function in type 2 diabetes patients with hyperuricemia

**Naohiko Ueno**
Ueno Internal Medicine and Diabetes Clinic, Japan

**Objective:** Hyperuricemia often causes kidney dysfunction which increases serum urate, forming a vicious cycle in the kidney. In this study, urate-lowering therapy was demonstrated in type 2 diabetes patients with hyperuricemia to evaluate the effect on diabetic nephropathy.

**Methods:** Type 2 diabetes patients with hyperuricemia (n=34) were treated by urate-lowering drugs. Serum urate levels, estimated glomerular filtration rate (eGFR), blood pressure, HbA1c, and urinary albumin-excretion rate (UAER) were measured for 52 weeks. The parameters at the end point when serum urate decreased to below 6.0 mg/dL and at 52 weeks were compared to the initial levels at week 0.

**Results:** Serum urate level decreased to the end point in all patients and was maintained at under 6.0 mg/dL throughout the observation period. eGFR significantly increased at the end point and also at 52 weeks. Overall UAER did not change after 52 weeks; however, the treatment decreased UAER significantly in patients with no microalbuminuria. There was a negative relationship between the change of serum urate levels and the change of eGFR, and a negative relationship between the baseline UAER and the change of UAER when patients with macroalbuminuria were excluded. There were no changes in HbA1c levels and blood pressure before and after the treatment.

**Conclusion:** There were significant improvements in kidney function by lowering serum urate levels to under 6.0 mg/dL and the effect was maintained for at least 52 weeks. This treatment may be one strategy to slow the progression of nephropathy in type 2 diabetic patients with hyperuricemia.

## Hemodialysis and peritoneal dialysis: Comparative study for the economic assessment of artificial kidney and peritoneal cleansing units in the region and the urban centers of the country, with units from the rest of the European Union and beyond

**Marilena G Koukou**
National and Kapodistrian University of Athens, Greece

We have recorded the characteristics as well as the total cost of treatment of a sample of 2,586 subjects undergoing dialysis and 100 patients peritoneal. The average age was at 68.7±1 years for the patients (63.7% being male) with an artificial kidney and the average age was at 64.5±16.8 years for the patients (54% being male) undergoing peritoneal dialysis. The cost does not differ considerably either from the remaining European countries or from non-European countries. As far as the artificial kidney is concerned, the average age ranges from 66.3±13.2 years (49.4% males) in Czech Republic to 68.9±15 years (58.8% males) in France. However, concerning peritoneal dialysis, Australia and New Zealand present an average age from 62 years (60% males) to 60.2±7.3 years (62.3% males) in Japan. In Greece, the most common cause of end-stage renal disease for patients with an artificial kidney is the unidentified presenting a percentage of 33.02%. A similar situation takes place in Spain (30.3%), Italy (30.3%), Hungary (41.7%), Poland (25.8%) and Portugal (28.1%). In our country, Greece, the most common cause the end-stage renal disease, concerning patients undergoing peritoneal dialysis is diabetes (32%), as well as in Australia, New Zealand (34,9%), Brazil (36%), Mexico (61%) and South Korea (48%). The average cost of hemodialysis per patient, based on figures from Belgium, Germany, Holland, England and France amounts to 66.212€, 44.575€, 65.739€, 29.322€ and 53.758€ corresponding, whereas in Greece the cost amounts to 39.800€ in public hospitals. More specifically, the cost for Greek patients undergoing peritoneal dialysis comes to 59.317€ per year and per individual (APD method) and to 44.797€ (CAPD method). In Denmark, the corresponding cost reaches 16.178€, in Spain it reaches 25.826€, in England 41.989€, in France 63.463€, in Belgium 67.580€, in Germany 73.892€, in Holland 77.254€ and in Switzerland 81.991€. The fore mentioned cost includes only the process of peritoneal dialysis. In conclusion, we have noticed, in our study, that the estimated cost for both methods of dialysis in Greece is similar to the cost in Canada, whereas it is higher in both European countries, such as Germany, France, Belgium, Holland, Switzerland and in non-European ones, for instance in America.

## Standardization of inpatient acute kidney injury referral

**Qiaoling Zhou**
Dorset County Hospital-NHS Foundation Trust, UK

**Introduction:** There is national variation in referring patients with acute kidney injury (AKI) to nephrology service and lacking of standardized referral framework. Timely appropriate referral of patients with AKI may allow earlier detection of primary renal disease and avoid delay in starting appropriate therapy. Potential benefits also include prevention of progressive AKI, avoidance of renal replacement therapy, improved chance of renal recovery, a shorter hospital stay and a better long term outcome. On the other hand, inappropriate referrals may waste resource and nephrologists time in triaging cases and replying the referring physicians, which could have been used to benefit those in real need.

**Objectives:** The primary objective of this quality improvement project was to assess the beneficial effects of a newly designed AKI referring pro forma, to assess the efficiency and quality of AKI referrals after standardization of inpatient (IP) AKI referral in the Wessex region of England.

**Methods:** This was a retrospective analysis of all cases of IP AKI referrals made from 01/10/2017 to 28/02/2018. A total of 183 referrals were made using the new pro forma vs. 12 made with handwriting referring letters (which was the usual practice of making a referral prior to the new pro forma before 01/10/20017). The primary outcome was to assess the timeframe and appropriateness of referrals with reference to NICE AKI referring criteria. The secondary outcome was to analyze AKI risk factors and prognosis.

**Results:** 86% (N=158) of AKI referrals made with the new pro forma were compliant with NICE guideline and were referred within 48 hours. The referrals made with the new pro forma were much easier to triage (from the nephrologists experience) and saved a meaningful amount of clinician's time. On the other hand, referrals made with individual referring physician's handwritten letters were poorly structured, difficult to triage or assess the appropriateness (due to incomplete information) and causing delay in both making referrals and reviews. Further analysis of referrals revealed elder age, multiple comorbidities, and baseline kidney injury were strong predictors of AKI risk factors, whereas peak creatinine level and length of hospital stay were predictors of poor prognosis after an episode of IP AKI.

**Conclusion:** Standardization of IP AKI referral by using a newly designed pro forma improves quality of referrals and saves clinicians' time in both making referrals (referring physician) and reviewing cases (nephrologists) per priority triage. After presenting this project, our trust has made a forward plan of an AKI E-referral (online), to further improve efficiencies in making AKI referrals across the Wessex region of England.

## Development of Raman spectroscopy technique for analysis of kidney stones

**Arif Demir, Belgin Genc Oztoprak** and **Erhan Akman**
BEAM ArGe Optics and Laser Technology Ltd., Turkey

Raman spectroscopic studies of the composition of urinary calculi using the spectra of different chemical components were reported in literature before. According to previous studies, it is cleared that by analyzing Raman spectra of human urinary stones, the chemical compositions of calcium oxalate, calcium phosphate, struvite and uric acid can be identified. For Raman applications the state art laser sources are fundamental (1064 nm) and harmonics wavelengths (532, 355 and 266 nm) of Nd:YAG laser. A promising application of Raman spectroscopy is the analysis of stones like kidney stones, uric acid stones, gall stones, (calcium oxalate monohydrate, cholesterol, black pigment stones and mixed stones). By investigating the exact stone composition, the most suitable treatment method can be derived. In this work, Raman spectroscopy system consisting of a high resolution spectrometer and a nanosecond-pulse Nd:YAG third harmonic laser was developed and used in analysis of kidney stones. The results are important in understanding kidney stone formation processes, which can lead to preventive therapeutic strategies and treatment methods for urological patients.

## Correlation between urine protein to creatinine ratio and 24 hour urine total protein excretion in proteinuria

**Fatma Saeed Khalifa Nafea, Montasser Mohamed Zeid, Akram Abd El-Monaem Deghady** and **Yasmine Salah Naga**
Alexandria University, Egypt

Twenty-four-hour urine total protein excretion is considered the gold standard method for proteinuria assessment. However, it can be cumbersome to perform and prone to errors in collection. For this reason, the use of the spot urine protein/creatinine ratio has been proposed. The aim of the present study is to assess the correlation, the difference and the agreement between the spot urine protein/creatinine ratio and the 24-h urine total protein excretion in samples collected consecutively from patients with sub-nephrotic and nephrotic range proteinuria. Consecutive paired determinations of 24-h urine total protein excretion and the spot urine protein/creatinine ratio were conducted in 80 patients; 40 patients with sub-nephrotic range proteinuria (Group I) and 40 patients with nephrotic range proteinuria (Group II). The strength of the correlation, the difference and the agreement between the two methods were determined. The spot urine protein/creatinine ratio and the 24-h urine total protein excretion were correlated in both groups with more strong correlation in the sub-nephrotic group. There was a statistically significant difference between the two methods in patients with nephrotic range proteinuria, focal segmental glomerulosclerosis (FSGS), lupus nephritis and acute kidney injury (AKI). Also, there was no agreement between the two methods in patients with nephrotic range proteinuria, FSGS, lupus nephritis and estimated glomerular filtration rate (GFR) (30–59 ml/min). The spot urine protein/creatinine ratio and the 24-h urine total protein excretion are correlated in both sub-nephrotic and nephrotic range proteinuria. But in nephrotic range proteinuria, the correlation is less and the difference is significant and there is no agreement between the two methods. Caution should be taken when interpreting the results of these two methods especially in patients with nephrotic range proteinuria, FSGS, lupus nephritis, AKI and estimated GFR (30–59 ml/min).

Extracorporeal membrane oxygenation (ECMO) is considered as a recognized lifesaving support for patients with cardiorespiratory failure. Acute kidney injury and fluid overload are one of the significant morbidity factors resulting in serious complications. Continuous renal replacement therapy (CRRT) using the device or inline hemofilter systems (IHS) without the device are the different ways of dialysis in patients with ECMO. IHS without the device offers alternate safe dialysis modality of choice because of users friendly, inexpensive and able to remove fluid overload and renal diffusive clearances efficiently. We report a 20 day old male neonate with multiple congenital cardiac defects needing venoarterial ECMO had acute kidney injury (AKI) and needing CRRT using inline hemofilter system (IHS) with no device. Patient was noted to have stable electrolyte parameters, good ultrafiltration and efficient diffusive clearance. He was decannulated from ECMO therapy after 9 days of his difficult course of illness without any related complications. Therefore, neonatal IHS without the device provides safe and efficient alternative approach in acute kidney injury.

## Left ventricular hypertrophy and cardiac remodeling in chronic kidney disease and hemodialysis patients, role of altered metabolism of some arginine derivatives

**Introduction:** Left ventricular hypertrophy (LVH) and left ventricular dysfunction are highly prevalent in patients with end-stage renal disease (ESRD). Interestingly, unlike the general population, in which coronary atherosclerotic disease is the principal cause of cardiovascular (CV) mortality, patients with chronic kidney disease (CKD) often die from chronic heart failure and sudden cardiac events resulting from left ventricular hypertrophy (LVH). Left ventricular hypertrophy (LVH) is present in 75% of the patients at the start of dialysis. Several studies suggest that left ventricular mass and function is strongly modulated by the nitric oxide (NO) system. Asymmetric dimethylarginine (ADMA), an endogenous inhibitor of endothelial-based NO synthase, is emerging as an important cardiovascular risk factor in ESRD patients.

**Objective:** To evaluate the relationship between plasma ADMA level and LVH among hemodialysis (HD) patients.

**Subjects & Methods:** Plasma ADMA measurements by enzyme-linked immunosorbent assay and echocardiographic evaluation were performed for 20 patients on regular HD, 20 patients with pre-dialysis chronic kidney disease, and 20 healthy age and sex-matched subjects as a control group.

**Results:** Mean values of plasma ADMA level were significantly high in all patient groups when compared with the control group ($P<0.001$). It was also seen that plasma ADMA was correlated with left ventricular mass index.

**Conclusions:** We concluded that dimethylarginine dimethylaminohydrolase (DDAH) levels significantly decrease with declining renal functions and this is probably the main cause of elevated plasma ADMA concentration among CKD and HD patients, hence inhibiting NO synthesis leading to endothelial dysfunction and subsequent cardiovascular events, elevated ADMA levels were positively correlating with increased left ventricular mass index (LVMI) commonly seen in CKD patients.

Monoclonal gammopathy of undetermined significance (MGUS) is consistent with immunoglobulin precipitation or deposition diseases occurring with B cell proliferation. Diagnostic features: proteinuria (>60% nephrotic range), microscopic hematuria (>65%), hypertension (>50%), renal insufficiency, antinuclear antibody (ANA) positive-speckled pattern (19%). Electron microscopy reveals 10-30 nm micro fibrils with random orientation in mesangium and glomerular capillary wall. A 36 years old male, presented with history of generalized weakness, nausea, reduced appetite and reduced urine output since 2 months. Hemodialysis was initiated in view of progressive renal dysfunction and underwent kidney biopsy. Autoimmune work up was not significant and diagnosis of dense deposit disease was made. Steroids started at 40 mg OD and tapered by 5 mg weekly. Hemodialysis (HD) sessions advised thrice a week through left femoral uncuffed non-tunnelled HD catheter. Left brachiocephalic arteriovenous fistula was created. Patient came for kidney transplant work up to our center with wife as a prospective donor. He was admitted for further work up and his biopsy was reviewed. Free kappa/lambda ratio of 28.38 (0.26–1.65). Biopsy impression was: widespread effacement/loss of visceral epithelial foot processes; massive mesangial accumulation of intermediate electron dense deposits with fine granular/short fibrillary appearance. He was diagnosed as a case of chronic kidney disease/stage VD/fibrillary glomerulonephritis. At present, patient is asymptomatic and on thrice a week HD at our center. Patient underwent six cycles of bortezomib and dexamethasone (once a week regimen). His initial serum creatinine was 10.8 mg/dl and now it had come down to 4.5 mg/dl. Repeat kappa/lambda ratio is 7.78.

## Does warm climate increase the risk of nephrolithiasis in children?

**Rahime Renda**
Antalya Education and Research Hospital, Turkey

Different environmental and genetic factors were determined in urolithiasis. The most common metabolic abnormalities are hypercalciuria and hypocitraturia. To determine the demographic data and clinical features in patients with nephrolithiasis in the pediatric group; we retrospectively evaluated the clinical, radiological, laboratory findings and metabolic risk factors of 129 children (74 boys and 55 girls) with nephrolithiasis between 2015 and 2017. Patient symptoms, urinary infection, metabolic disturbances, radiological findings and treatment modalities were determined. The mean age of children was 7.2±3.4 years. The most common symptoms were macroscopic hematuria and renal colic. Urinary tract infection in 17 cases (13%) and 64 cases (50%) have calculus which was located bilaterally in the kidneys. Hyperuricosuria in 44 cases (34%), hypercalciuria in 15 cases (11%), hypocitraturia in 12 cases (9%), hyperoxaluria in 12 cases (9%) and cystinuria in 3 cases (2%) were found. We think that living in warm climates increase the risk of harboring kidney stones due to dehydration, which leads to a high excretion of urinary calcium and other minerals that promote the growth of kidney stones.

## Comparison between erythropoietin alfa biosimilars and reference product in anemic patients of chronic kidney disease

Patent expiration for erythropoietin alfa in Europe in 2004 led to development of biosimilar erythropoietin alfa, recombinant human erythropoietin (rhuEPO) is used for treatment of anemia due to renal failure. Our study aimed to evaluate clinical efficacy of two biosimilars from different manufacturers relative to innovator product Eprex (Cilag.AG. Switzerland). Clinical efficacy is assessed as a function of therapeutic equivalence of a biosimilar and innovator product through a parallel, randomized single blind study in 35 patients with anemia result from chronic kidney disease and had not received EPO previously. The primary efficacy endpoint was the serum EPO level which measured by enzyme immunoassay (ELISA) during 120 hours after administration of a single 4000 IU dose. The secondary endpoints were the hematological parameters (the hemoglobin, hematocrit, total serum iron levels and reticulocyte) before and after treatment. This study confirmed presence of significant difference between reference erythropoietin (EPO) alfa group (Eprex) and biosimilars erythropoietin alfa groups (A) in terms of serum EPO profile but biosimilars have similar EPO profile to Eprex and no significant difference with Eprex in clinical efficacy and hematological parameters.

**Background:** Parvovirus B19 is a DNA virus which is responsible for several various diseases in human. Parvovirus B19 induced persistent anemia is one of its manifestations which is relatively common in the setting of transplant recipients. This study was aimed to investigate the seroprevalence of parvovirus B19 among kidney transplant recipients.

**Methods:** Ninety one transplant recipients were selected randomly, and were investigated for several variables including age, sex, educational status, history of hemodialysis (HD), history of blood transfusion, and immunosuppressive therapy. 2 cc of blood samples were collected via venipuncture and evaluated for anti-parvovirus B19 IgG antibody using enzyme linked immunosorbent assay (ELISA).

**Results:** All recipients were anemic, 72.5% of them suffering from severe anemia (Hb ≤ 11 in men and ≤ 10 in women). Sixty three patients (69.2%) were seropositive for parvovirus B19. There was no significant difference among the age, sex, educational status, history of blood transfusion, history of HD, and the immunosuppressive therapy of seropositive and seronegative groups.

**Conclusion:** The seroprevalence of parvovirus B19 was relatively high in the setting of kidney transplant recipients. Anemia is a common problem in these patients and often remains under-treated. However our study failed to find a correlation between the severity of anemia and seropositivity of parvovirus B19.

## Distal-opening-proximal-closing double zipper model of guinea pig tubular urethra and penile formation, a better model for human hypospadias

**Zhengui (Patrick) Zheng**
Southern Illinois University School of Medicine, USA

Hypospadias is one of the most common congenital anomalies, occurring in approximately 1 in 250 live births, roughly 1 in 125 live male births. Tubular urethra formation in humans was described as distal-opening and proximal-closing "double zippers", but similar process has never been shown in any other published animal models. After studying the embryology and sexual differentiation of the guinea pig external genitalia, we revealed the penile masculinization process is similar to humans. Canalization and dorsal-to-ventral movement of the urethral canal develops the urethral groove (UG) in both sexes. UG formation is an important step in external genitalia development and penile formation, but the cellular and molecular mechanisms of UG formation have never been discovered for being lack of appropriate animal models. We found differential cell proliferation and cell death in developing urethral epithelium led to UG formation and Shh expression in ventral surface epithelium of genital tubercle plays important roles. When exposed to androgen, the UG of males performed distal-opening and proximal-closing to form tubular urethra. More nuclear localized androgen receptors were found in genital tubercles of males than females at developing external genitalia. Antiandrogen treatment at E26-30 could induce severe hypospadias, but only reduced penile size when treated after E30. Methyl-testosterone administration at E27-31 can cause penile formation in females. Our data suggest guinea pig is an appropriate model for further study of cellular and molecular mechanisms involved in distal-opening-proximal-closing in tubular urethra formation and the evaluation of the etiology and pathophysiological processes of hypospadias.

## Crosstalk between Connexin 32 and mitochondrial apoptosis signaling pathway plays a pivotal role in renal ischemia reperfusion: Induced acute kidney injury

[2]Guangdong Provincial Key Laboratory of Liver Disease Research, The Third Affiliated Hospital of Sun Yat-sen University, China

[3]Yuedong Hospital, The Third Affiliated Hospital of Sun Yat-sen University, China

**Aims:** Perioperative acute kidney injury (AKI) resulted by renal ischemia reperfusion (IR) is not conducive to the surgical patients' recovery. Our previous study demonstrated that reactive oxygen species (ROS) transmitted by gap junction (GJ) composed of connexin32 (Cx32) contributed to AKI. However, its underlying mechanisms were largely unknown. Thus, the present study focuses on the deeper reasons for AKI aggravation, relative with ROS transmitted by Cx32.

**Results:** In vivo studies, renal IR caused severe impairment in renal tissues and a mass of ROS generation, which were coincident with activation of NF-κB/p53/PUMA-mediated mitochondrial apoptosis pathways. Cx32 deficience alleviated renal IR-induced AKI, and simultaneously attenuated ROS generation and distribution in renal tissues, which further inhibited NF-κB/p53/PUMA-mediated mitochondrial apoptosis pathways. Similarly, in vitro studies, hypoxia reoxygenation (HR)-induced cellular injury and cell apoptosis in both human kidney tubular epithelial cells (HK-2) and rat kidney tubular epithelial cells (NRK52E) were significantly attenuated by Cx32 inhibitors or Cx32 gene knock-down. More importantly, Cx32 inhibition not only decreased ROS generation and distribution in human or rat kidney tubular epithelial cells, but also inhibited its downstream NF-κB/p53/PUMA-mediated mitochondrial apoptosis pathways activation.

**Innovation & Conclusion:** This is the first time to elaborate the deep mechanisms of IR-induced renal injuries integrally. Cx32 plays a critical role in IR-induced AKI. GJ composed of Cx32 manipulates ROS generation and distribution between neighboring cells, which alters activation of NF-κB/p53/PUMA-mediated mitochondrial apoptosis pathways. Both inhibiting Cx32 function and scavenging ROS effectively reduce mitochondrial apoptosis and subsequently attenuate AKI, providing effective strategies for kidney protection.
