Reversing the increase of HIV/AIDS rates: A case of Uganda

Jacob Waiswa

Makerere University, Uganda

Abstract

HIV/AIDS in Uganda has been rising steadily since the late 1990s. There is need to explore the dynamics behind the steady rise of the prevalent rate despite earlier successes. The leadership lost focus when it turned pure capitalist, and over the years the welfare of the masses got neglected, health system collapsed, through uncontrolled corruption. The ABC strategy was unrealistic and a contributor to the mess. More strict measures are wanting to realise zero tolerance to HIV infection, emphasizing condom use and HIV testing, respectively; circumcision's 60% HIV survival chance is not reliable, only so as part of the HIV/AIDS prevention package.
