About OMICS Group

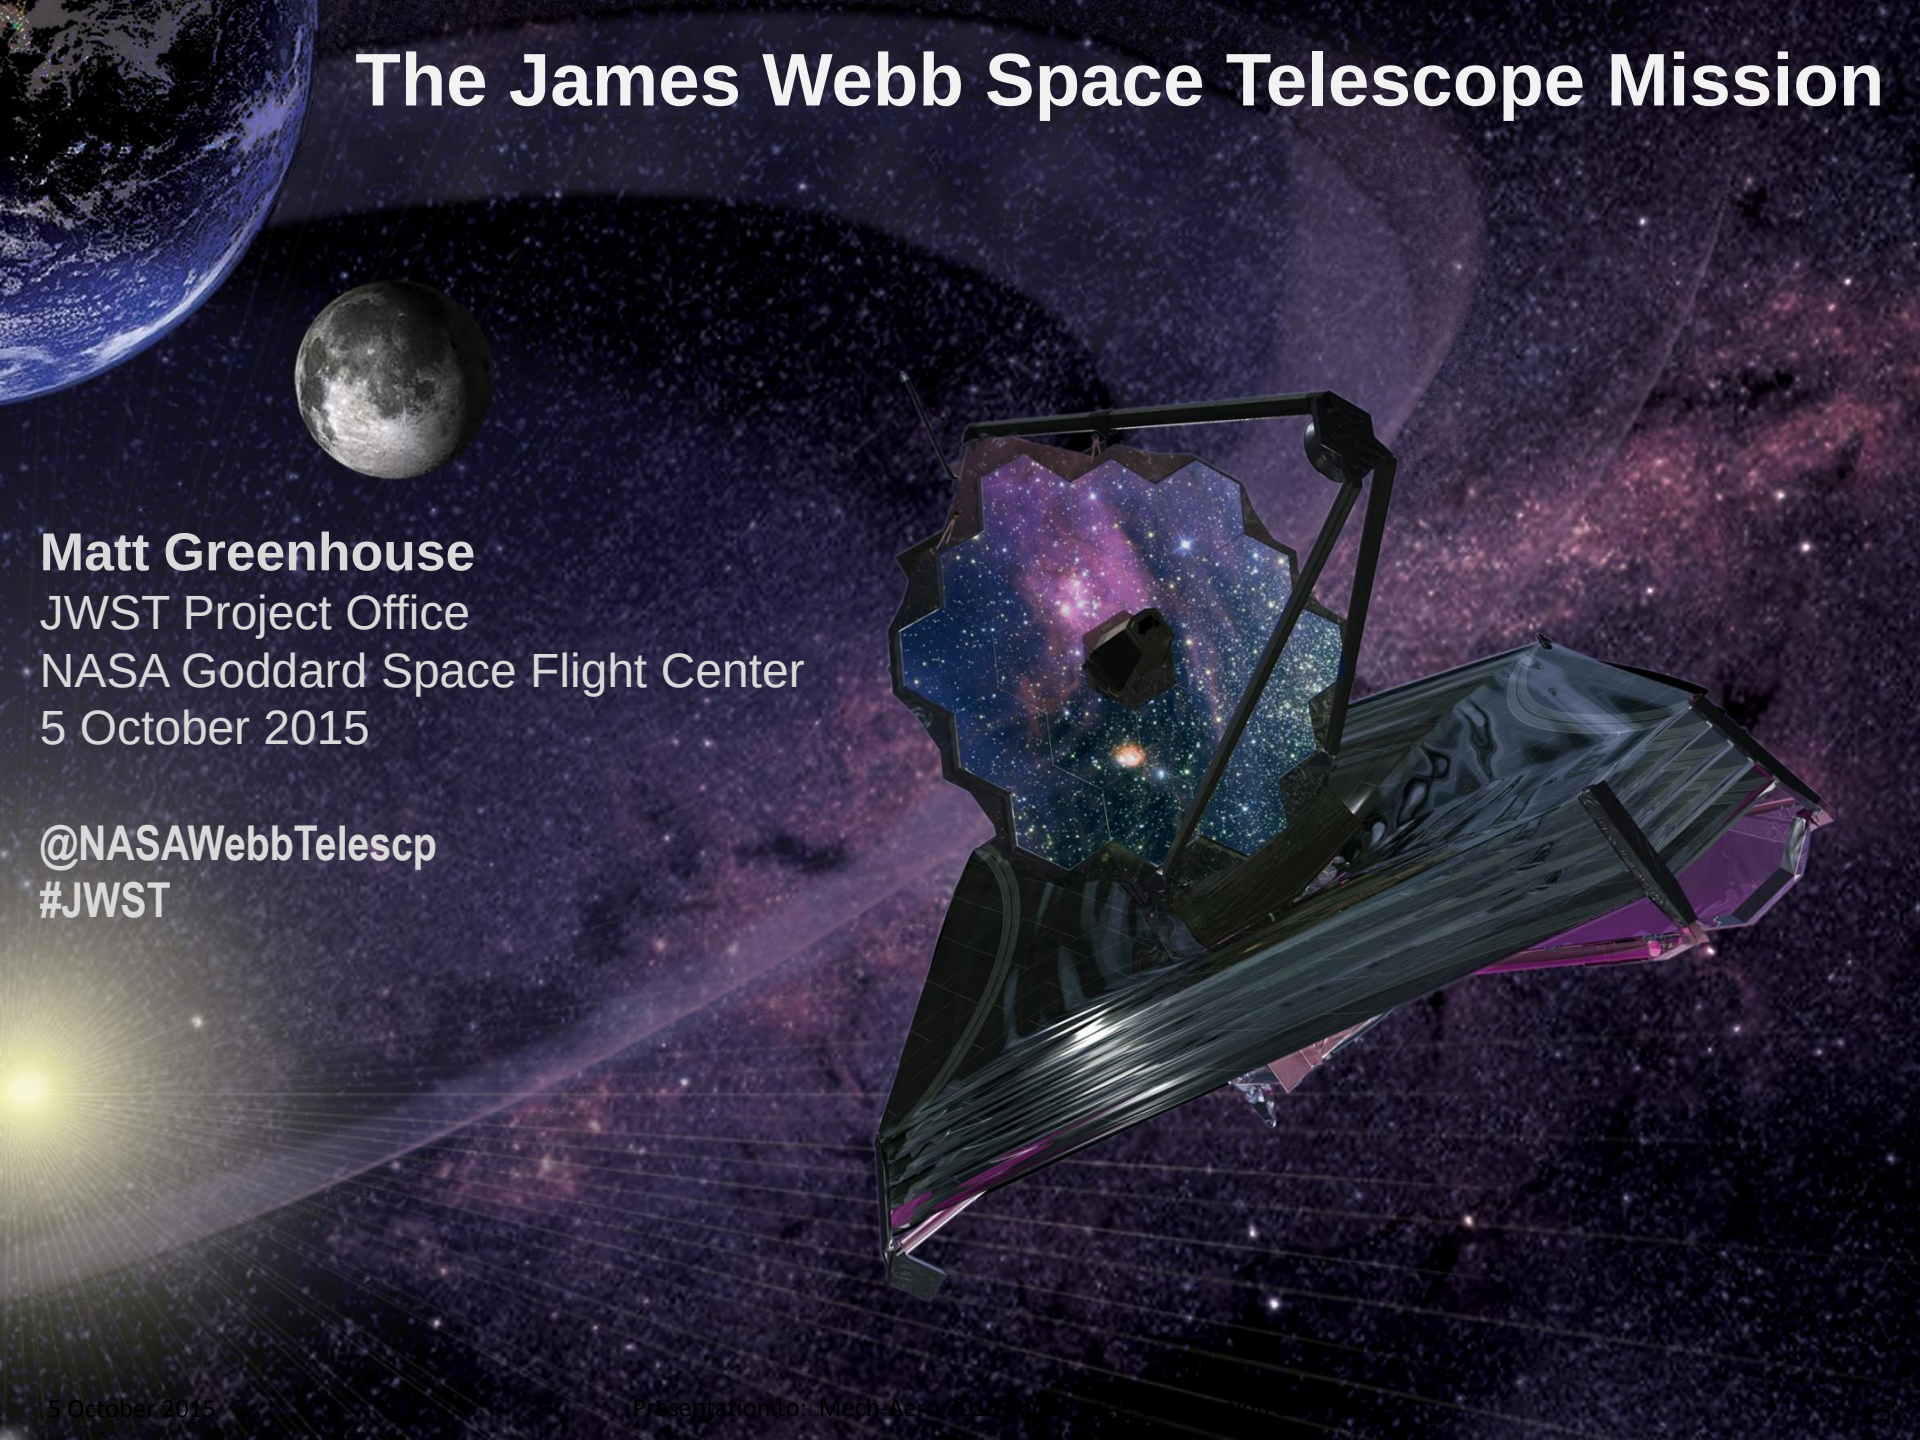

OMICS Group International is an amalgamation of Open Access publications and worldwide international science conferences and events. Established in the year 2007 with the sole aim of making the information on Sciences and technology 'Open Access', OMICS Group publishes 400 online open access scholarly journals in all aspects of Science, Engineering, Management and Technology journals. OMICS Group has been instrumental in taking the knowledge on Science & technology to the doorsteps of ordinary men and women. Research Scholars, Students, Libraries, Educational Institutions, Research centers and the industry are main stakeholders that benefitted greatly from this knowledge dissemination. OMICS Group also organizes 300 International conferences annually across the globe, where knowledge transfer takes place through debates, round table discussions, poster presentations, workshops, symposia and exhibitions.

About OMICS Group Conferences

OMICS Group International is a pioneer and leading science event organizer, which publishes around 400 open access journals and conducts over 300 Medical, Clinical, Engineering, Life Sciences, Pharma scientific conferences all over the globe annually with the support of more than 1000 scientific associations and 30,000 editorial board members and 3.5 million followers to its credit.

OMICS Group has organized 500 conferences, workshops and national symposiums across the major cities including San Francisco, Las Vegas, San Antonio, Omaha, Orlando, Raleigh, Santa Clara, Chicago, Philadelphia, Baltimore, United Kingdom, Valencia, Dubai, Beijing, Hyderabad, Bengaluru and Mumbai.

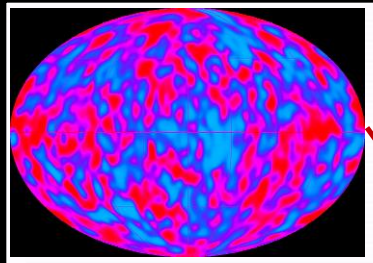

The James Webb Space Telescope Mission

JWST Project Office
NASA Goddard Space Flight Center
5 October 2015

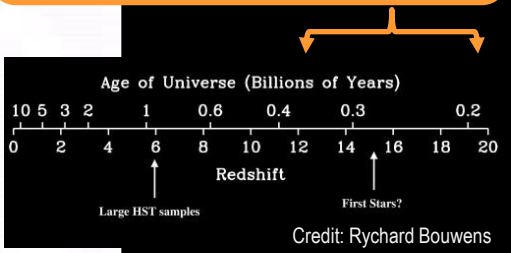

@NASAWebbTelescp
#JWST

JWST is designed to look back in time to see the first galaxies

COBE: The oldest light

First Light (After the Big Bang)
First luminous objects, proto-galaxies, supernovae of first stars

Credit: Rychard Bouwens

Cosmic Dark Zone

3 minutes

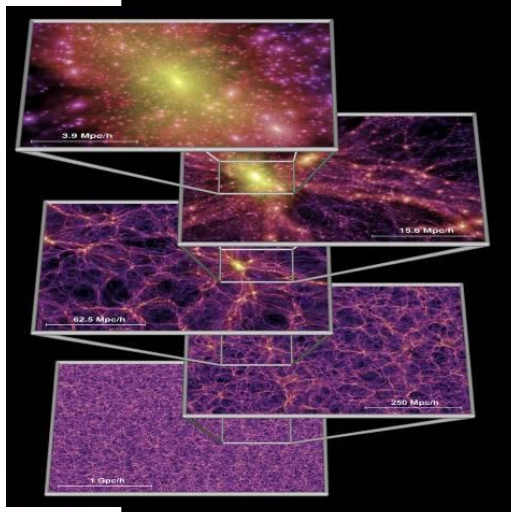

300,000 years

100 million years

1 billion years

13.7 billion years

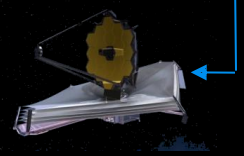

Millennium Simulation

WMAP

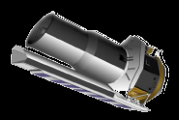

COBE

JWST

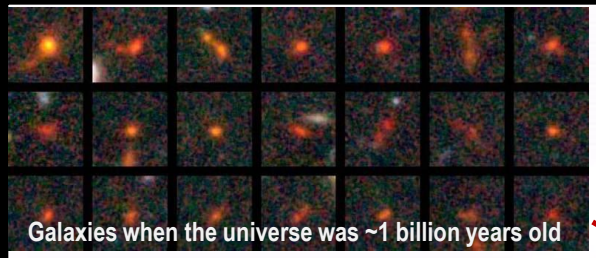

HST

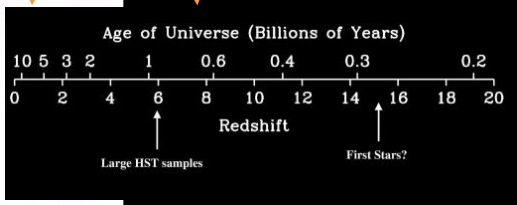

Spitzer

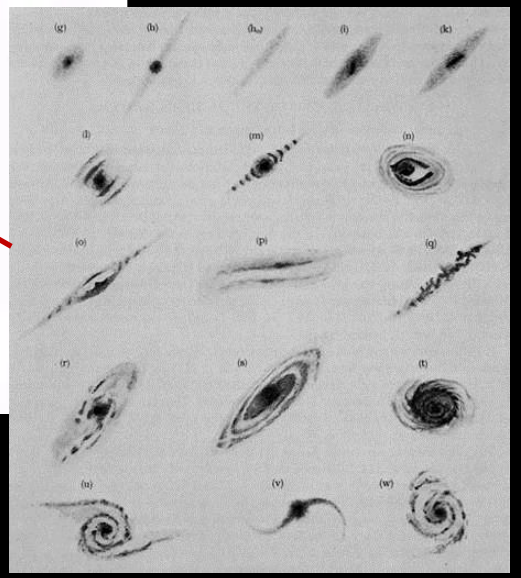

JWST will image the infrared universe with unprecedented clarity

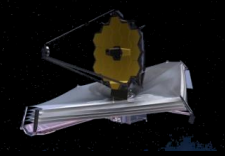

First Light (After the Big Bang)
First luminous objects, proto-galaxies, supernovae, black holes

Assembly of Galaxies
Merging of proto-galaxies, effects of black holes, history of star formation

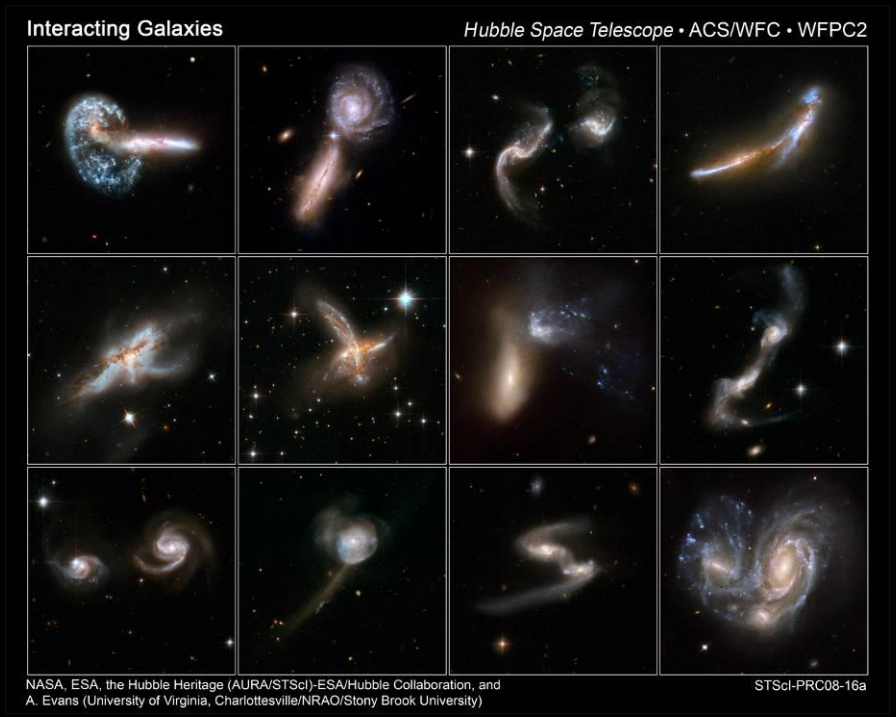

Galaxies today

JWST

JWST will see how the structure and composition of galaxies evolve across cosmic time

Click Video

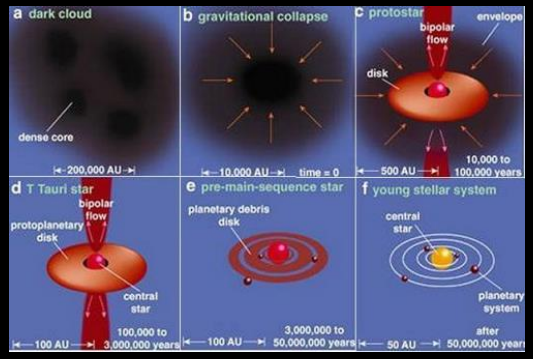

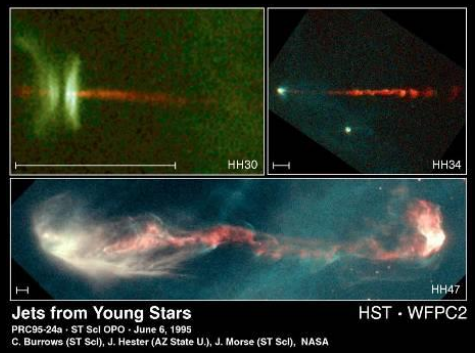

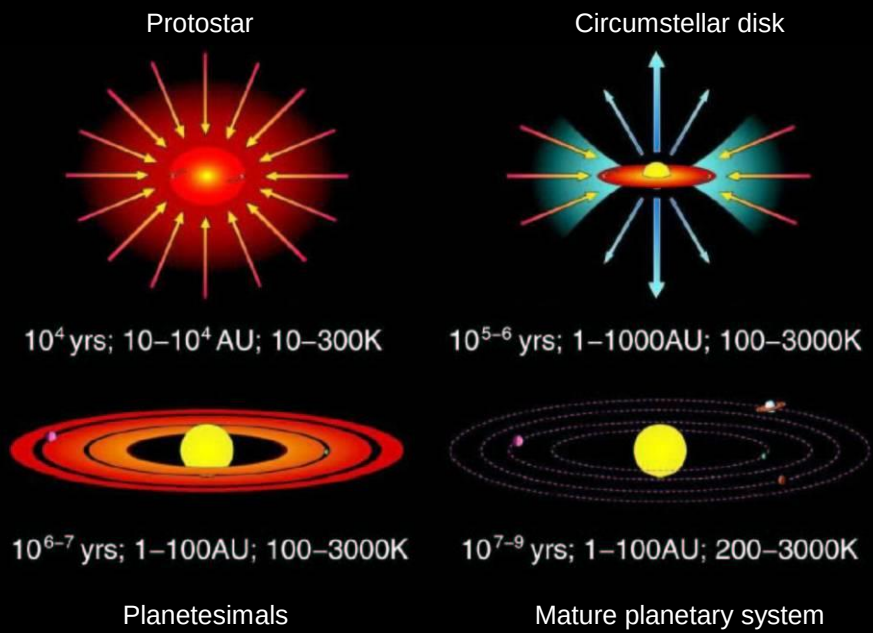

JWST will see into the birthplaces of stars to reveal how they form

Birth of Stars and Planetary Systems
How stars form and chemical elements are produced

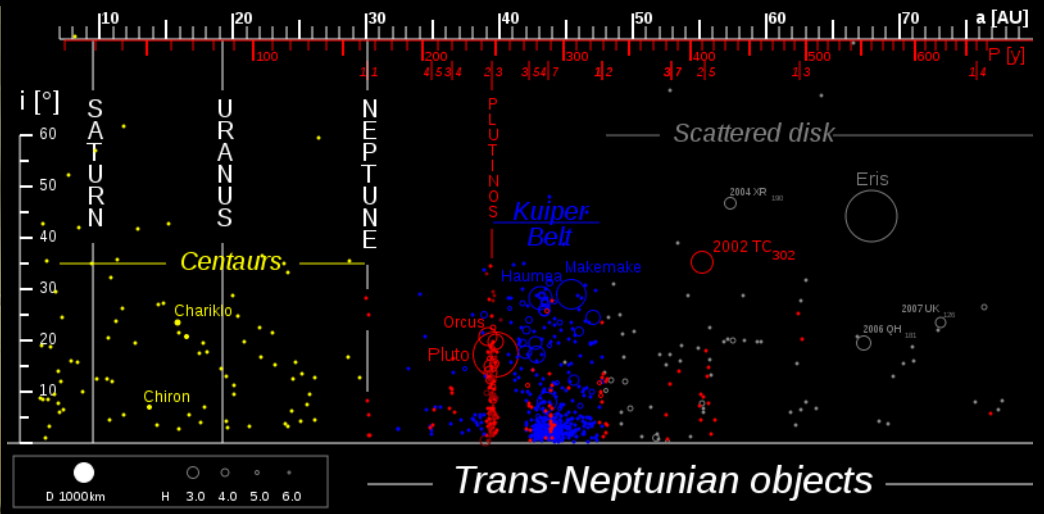

The Eagle Nebula as seen in the near-infrared

JWST will observe how planetary systems form and evolve

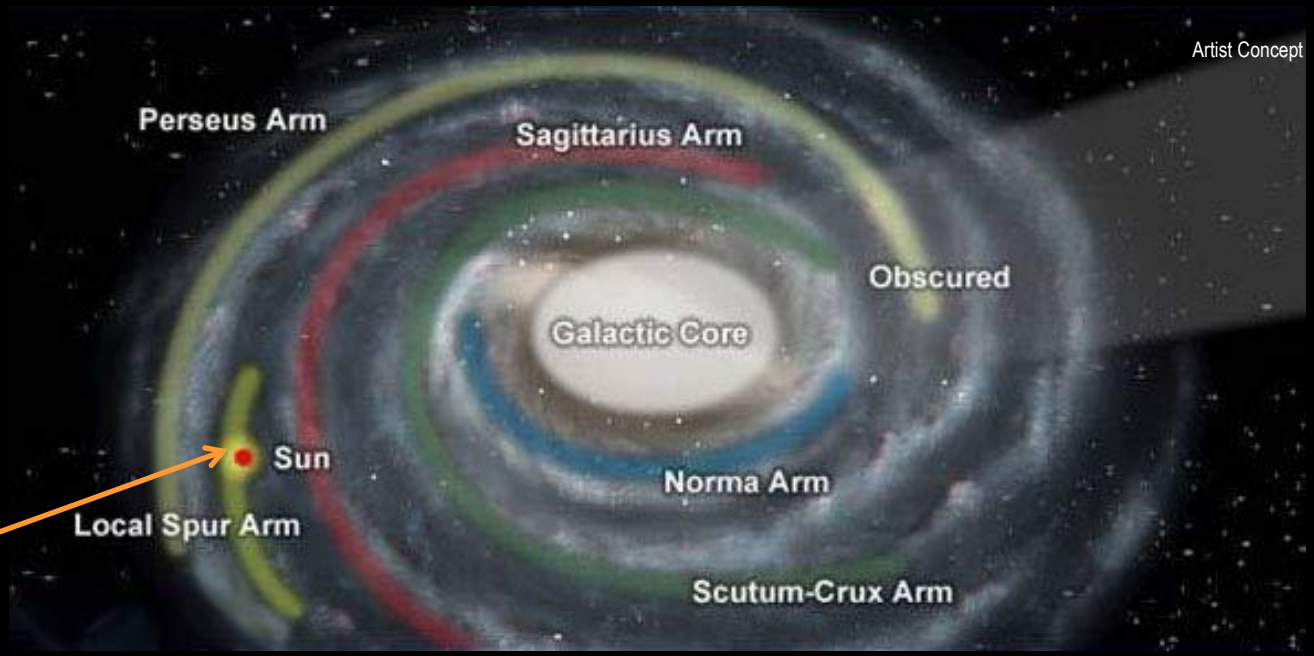

First Light (After the Big Bang)
First luminous objects, proto-galaxies, supernovae, black holes

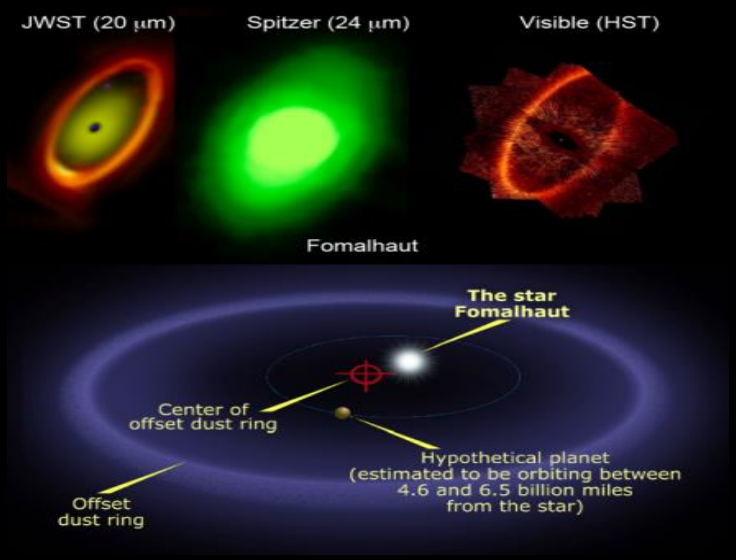

Assembly of Galaxies
Merging of proto-galaxies, effects of black holes, history of star formation

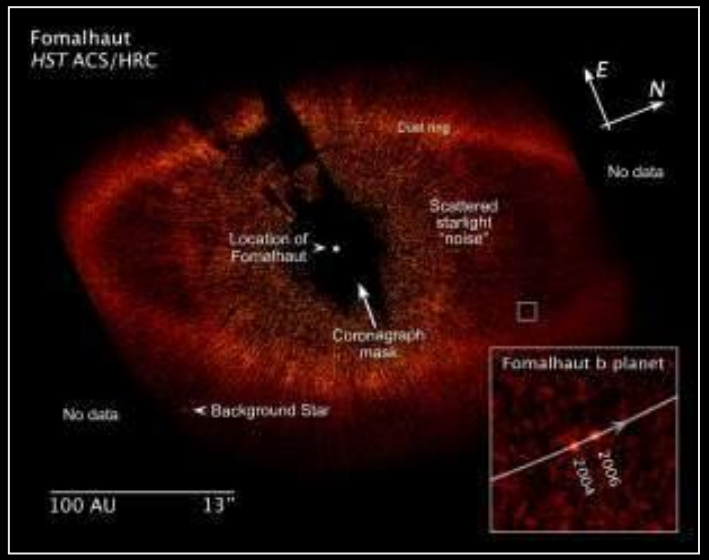

Birth of Stars and Planetary Systems
How stars form and chemical elements are produced

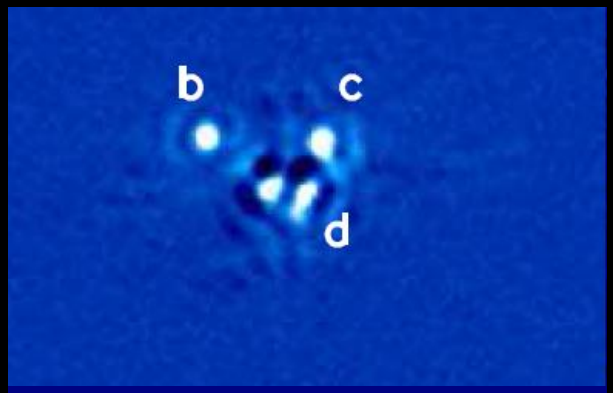

Planetary Systems & Origins of Life
Formation of planets

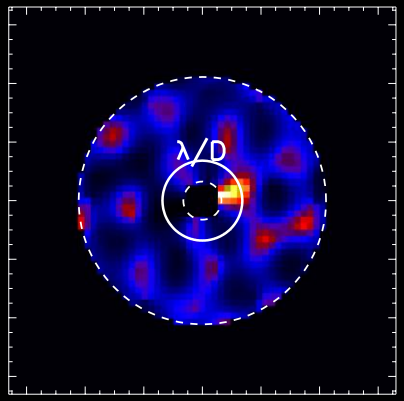

JWST will image exoplanets (planets orbiting stars other than the Sun)

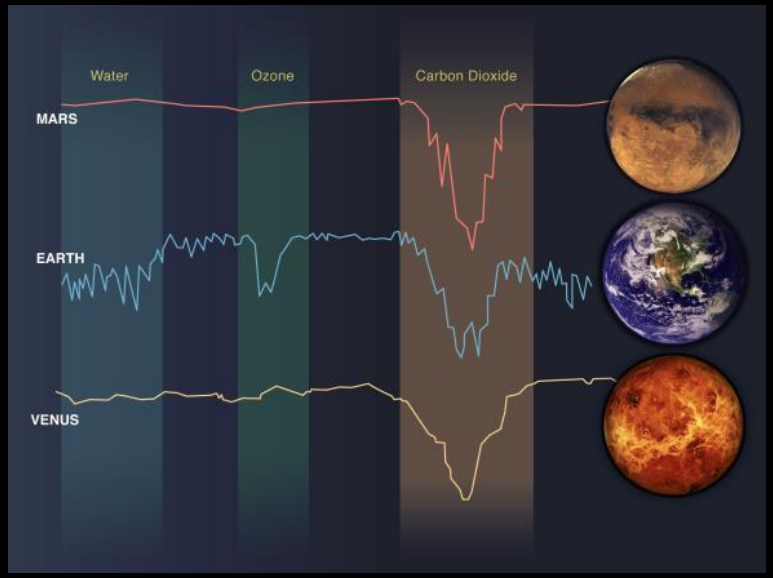

JWST simulated mid-infrared image of planets orbiting star HR 8799.

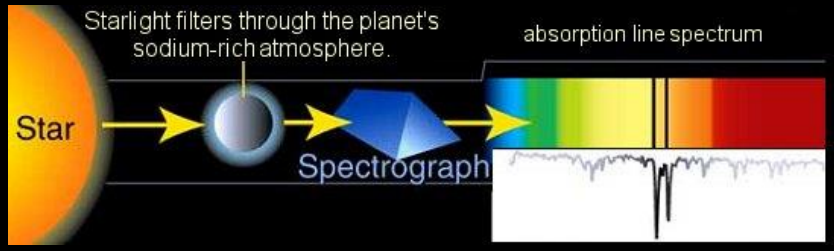

JWST simulated near-infrared image of a 1-2 M_{Jup} planet at ~1 AU of a M0V star 10 pc from the Sun.

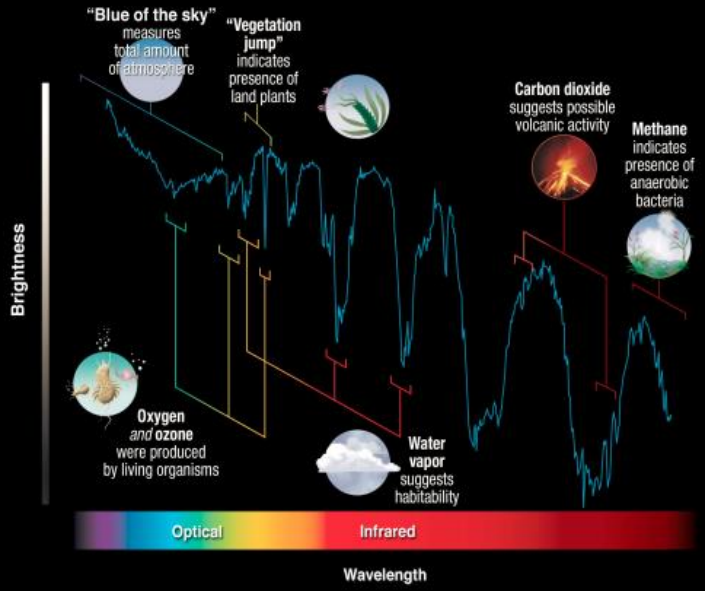

JWST will revolutionize understanding of exoplanet atmospheres

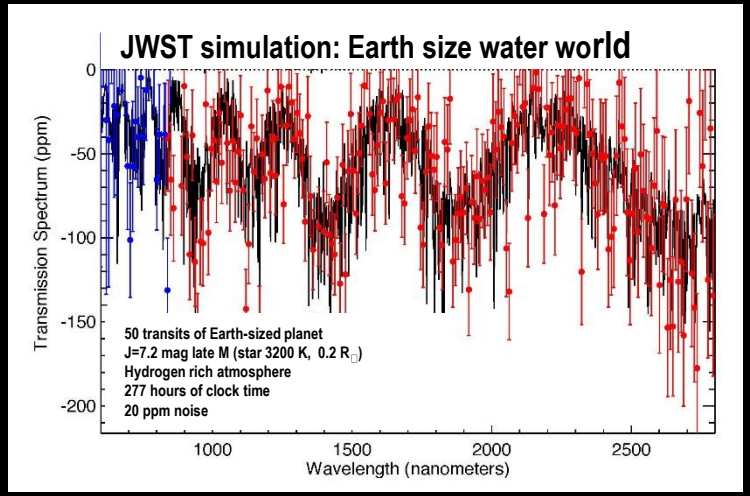

Composition is revealed by spectroscopy

So is the presence of life!

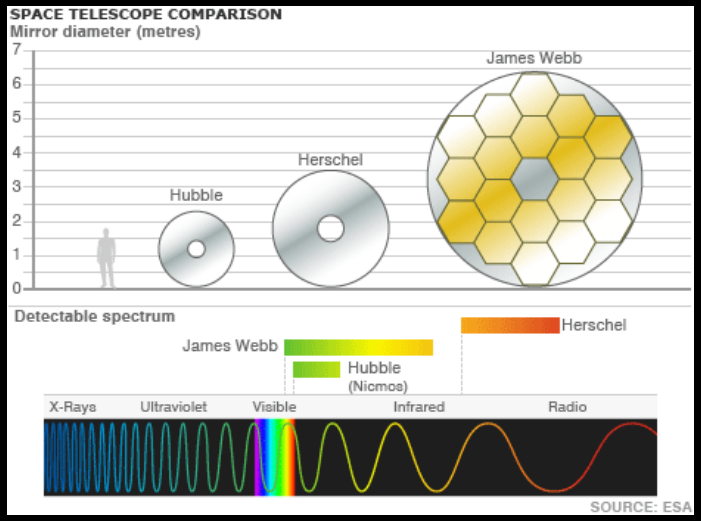

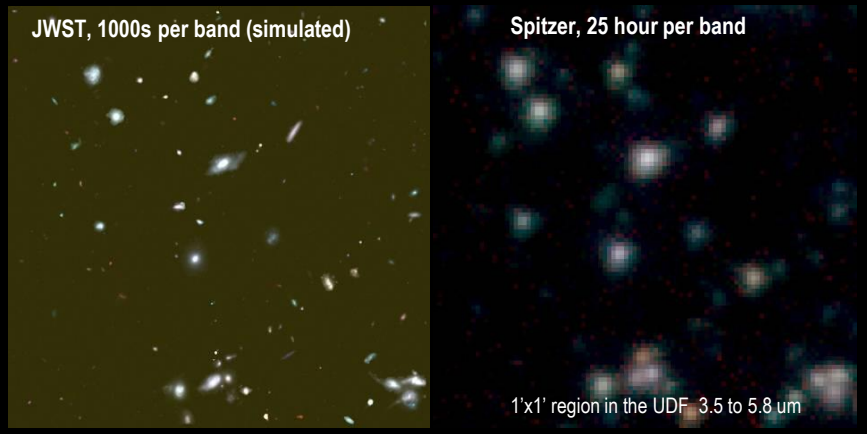

There are tens of billions of habitable worlds in our galaxy. JWST can detect liquid water on an exoplanet that is a few times the size of the Earth.

JWST requires the largest cryogenic telescope ever constructed

To achieve its science objectives, the JWST mission requires:

- 7X the light gathering capability of the Hubble Space Telescope
- Observing capability spanning the optical to mid-infrared spectrum
- Hubble-like angular resolution in the near-infrared

JWST will provide the first high definition view of the infrared universe

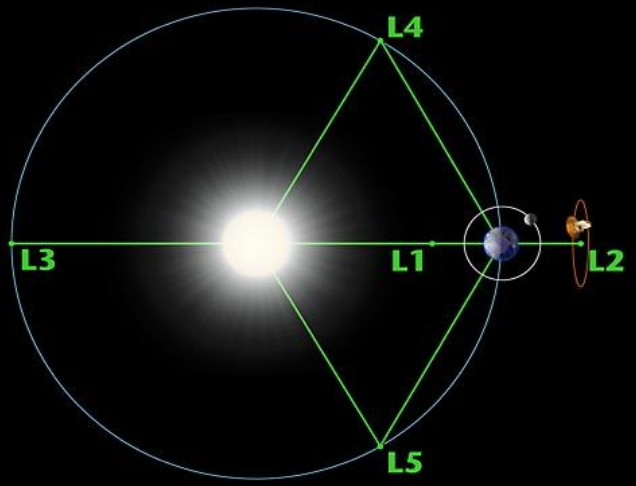

To meet these requirements, the JWST team had to solve two key problems:

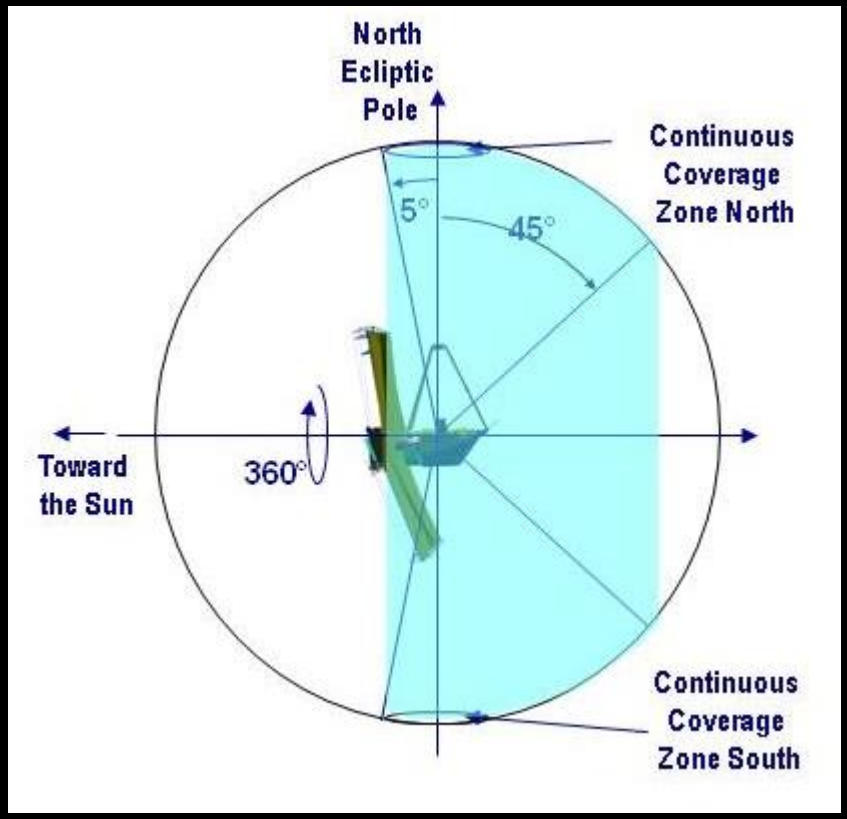

- Provide a primary mirror that is larger in diameter than available rocket fairings
- Achieve a high stability cryogenic 40K (-233 C, -388 F) operating temperature

The JWST will be placed in orbit about the Sun-Earth L2 point approximately 1.5 million km from Earth

An L2 point orbit was selected for JWST to enable passive cryogenic cooling

- Station keeping thrusters are required to maintain this orbit
- Propellant sized for 11 years (delta-v ~ 93 m/s)
- ~100 day direct transfer trajectory

The JWST can observe the whole sky while remaining continuously in the shadow of its sunshield

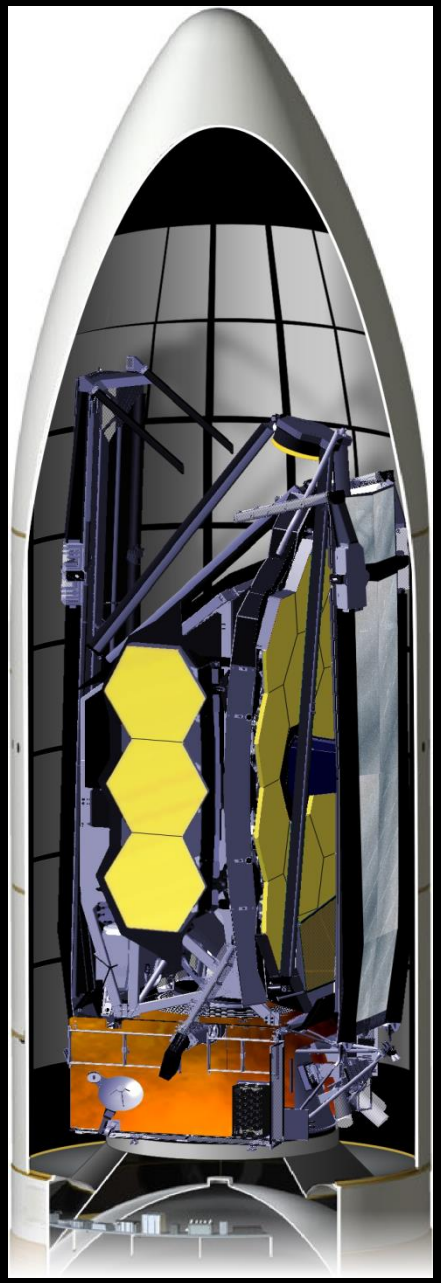

- Field of Regard is an annulus covering 35% of the sky
- The whole sky is covered each year with small continuous viewing zones at the Ecliptic poles

The telescope requires a segmented deployable mirror

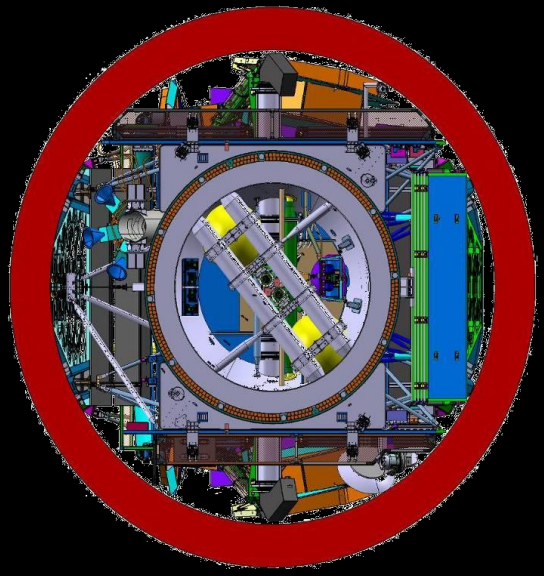

Ariane 5 ECA

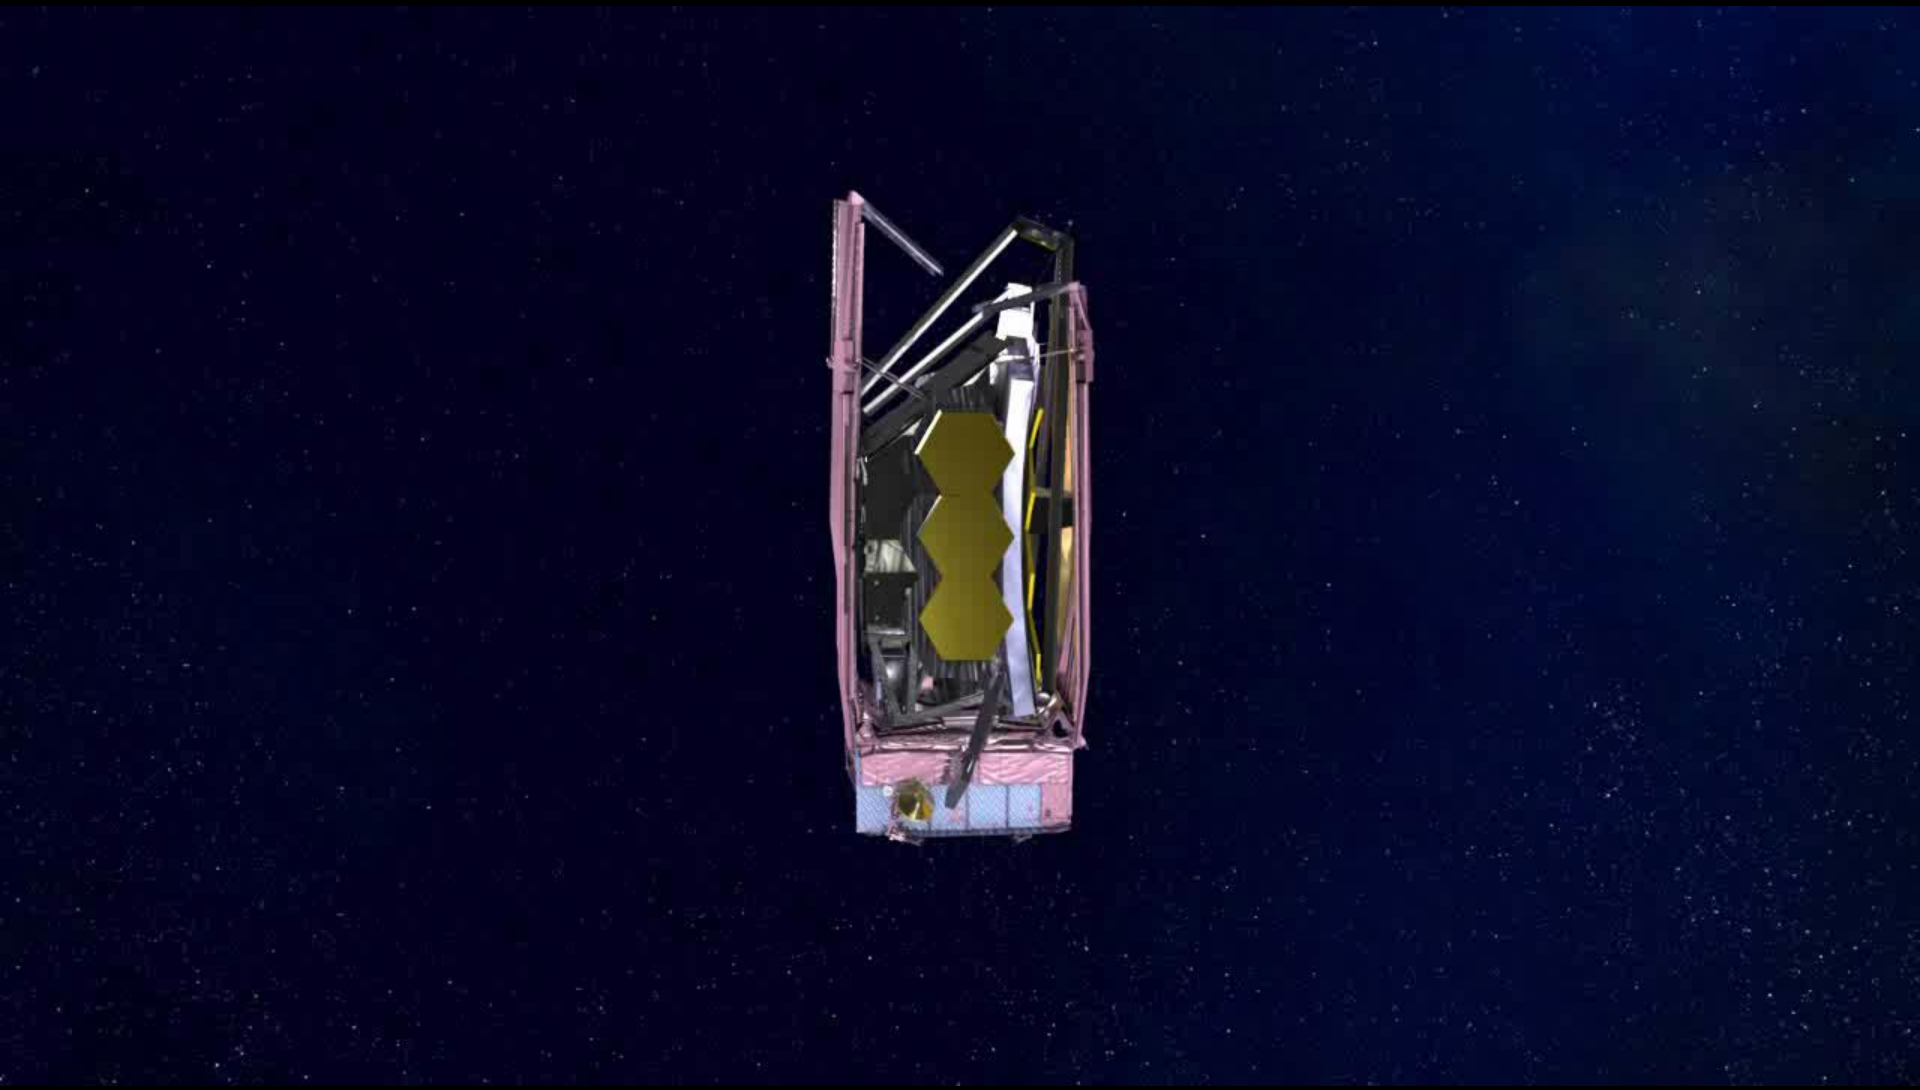

- Ariane V ECA launch vehicle (5 m diameter fairing)
- Launch from Kourou Launch Center (French Guiana) with direct transfer to L2 point.
- 6530 kg payload launched at ambient temperature with on orbit cooling to 50 K via passive thermal radiators
- 40 deployable structures and 178 release devices

Deployment Sequence Overview

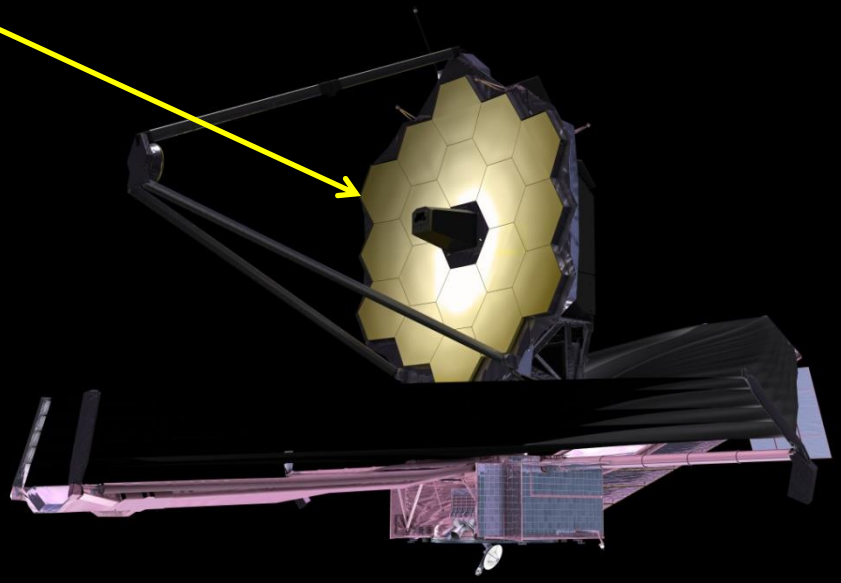

The JWST space vehicle consists of three elements

Optical Telescope Element (OTE)
Collects star light from distant objects

Integrated Science Instrument Module (ISIM)
Extracts physics information from star light

Spacecraft
Attitude control, telecom, power & other systems

The telescope mirrors are fabricated from Beryllium

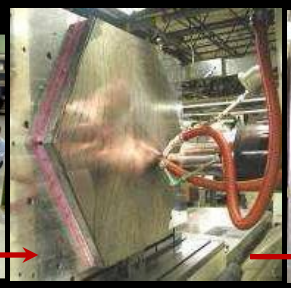

Key physical properties of Beryllium:

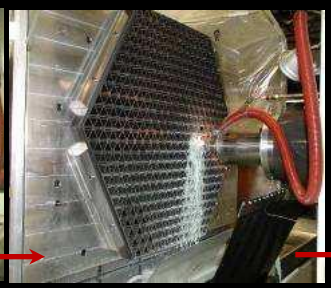

- low coefficient of thermal expansion at 50 K
- high thermal conductivity
- high stiffness to mass ratio
- Type O-30 spherical powder
  - uniform CTE, high packing density, low oxide content

Primary mirror mass properties

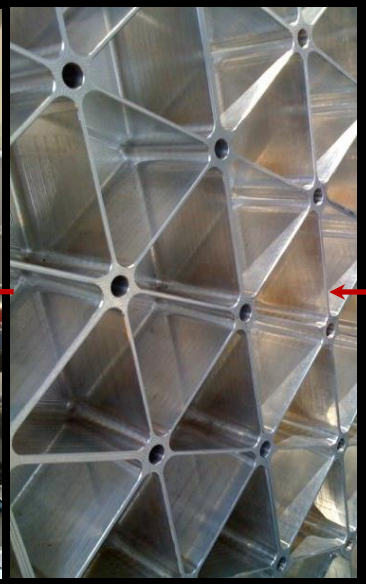

- substrate: 21.8 kg
- segment assembly: 39.4 kg
- OTE area density: ~28 kg m^{-2}
  - HST (ULE) ~ 180 kg m^{-2} (~ 6X heavier)
  - Keck (Zerodur) ~ 2000 kg m^{-2} (~71X heavier)

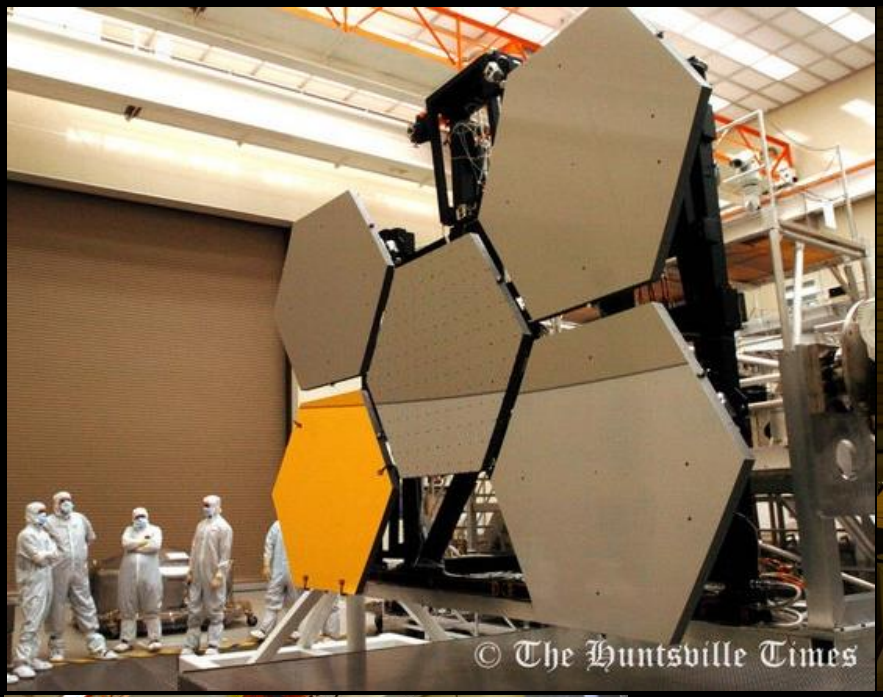

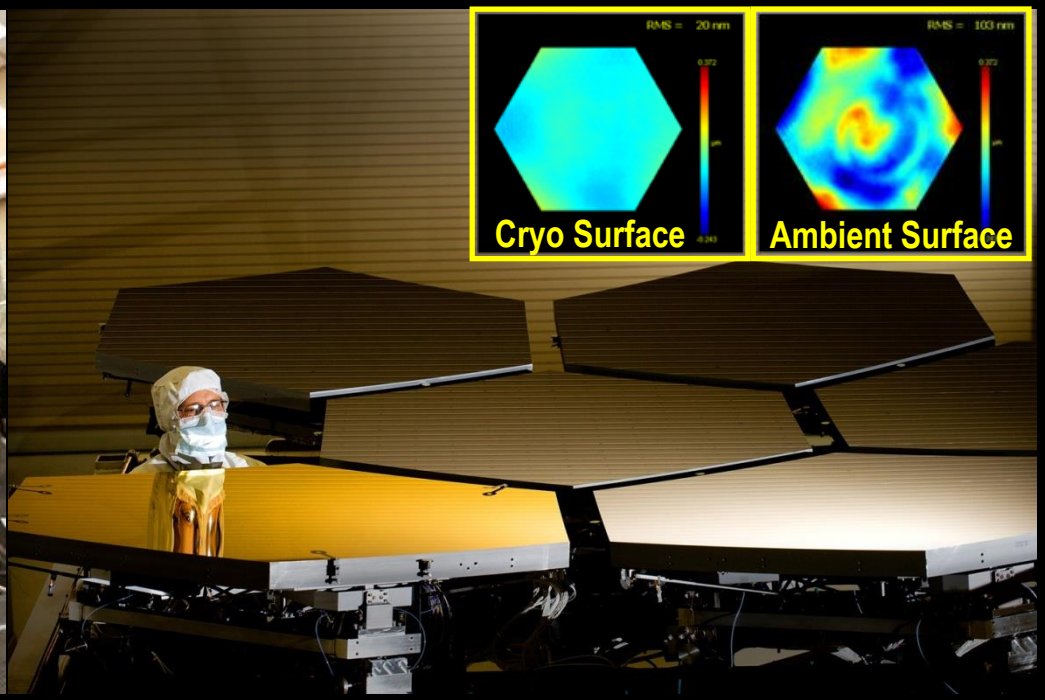

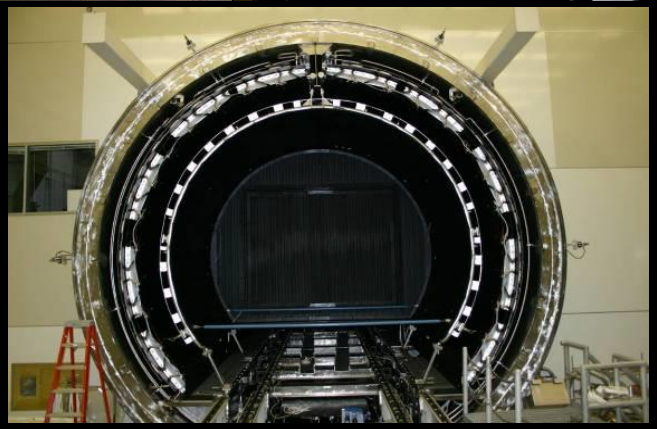

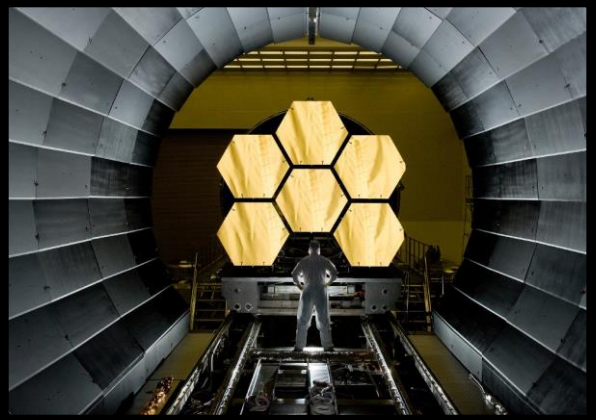

A specially instrumented space simulation chamber at Marshall Space Flight Center was used to optically test the primary mirror segments at 50 K (-225 C, -370 F)

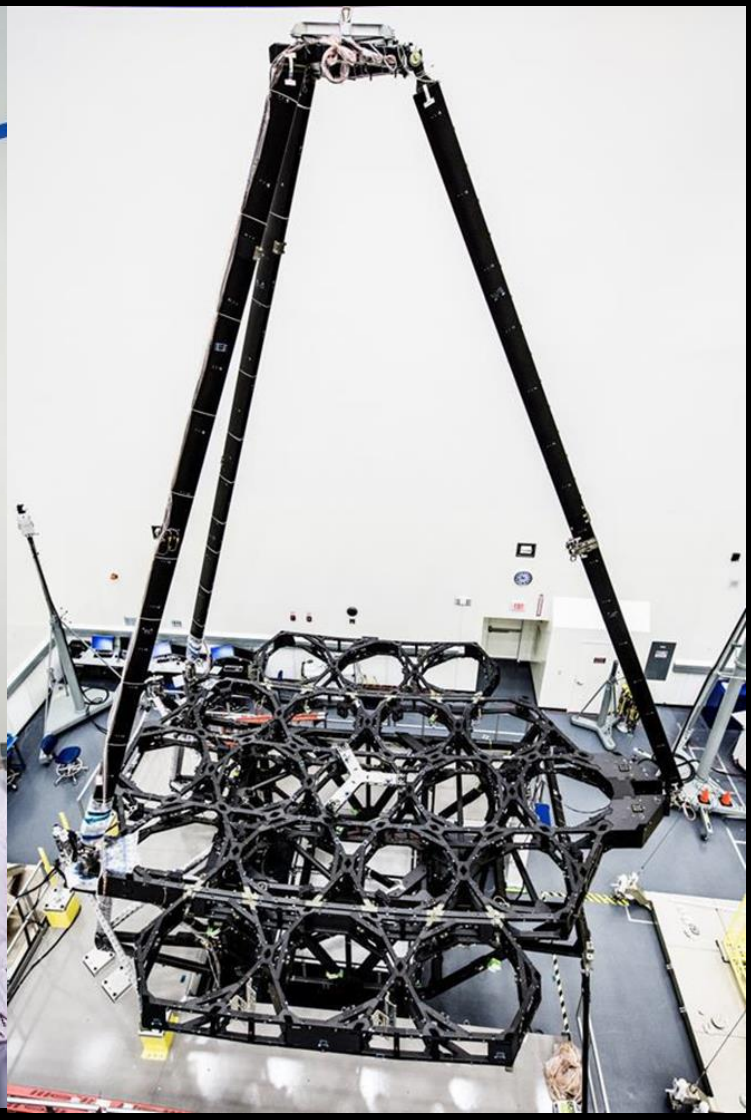

Buildup of telescope flight structure is complete

The structure consists of ~3,200 bonded composite piece parts

OTE pathfinder structure manual deployment test: June 2014

The spacecraft bus structure is nearing completion

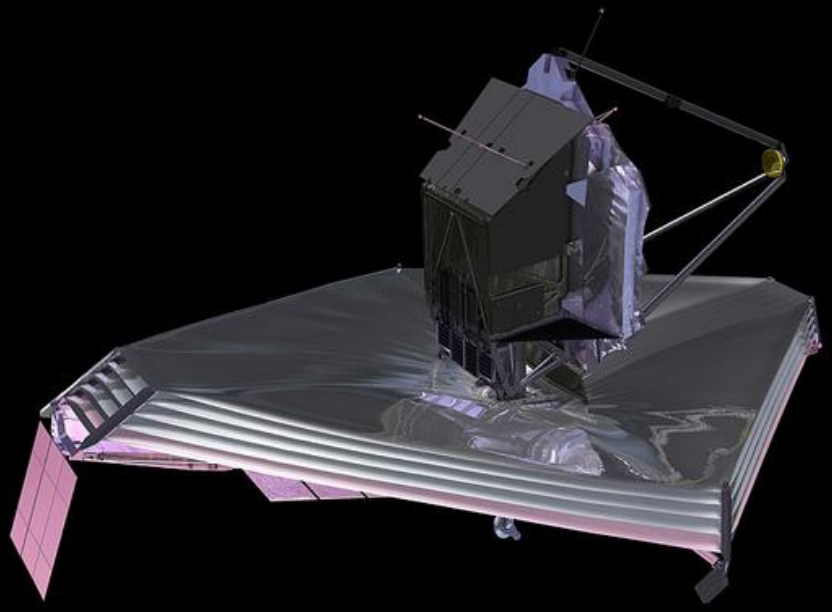

Spacecraft and OTE structure fit check has been completed

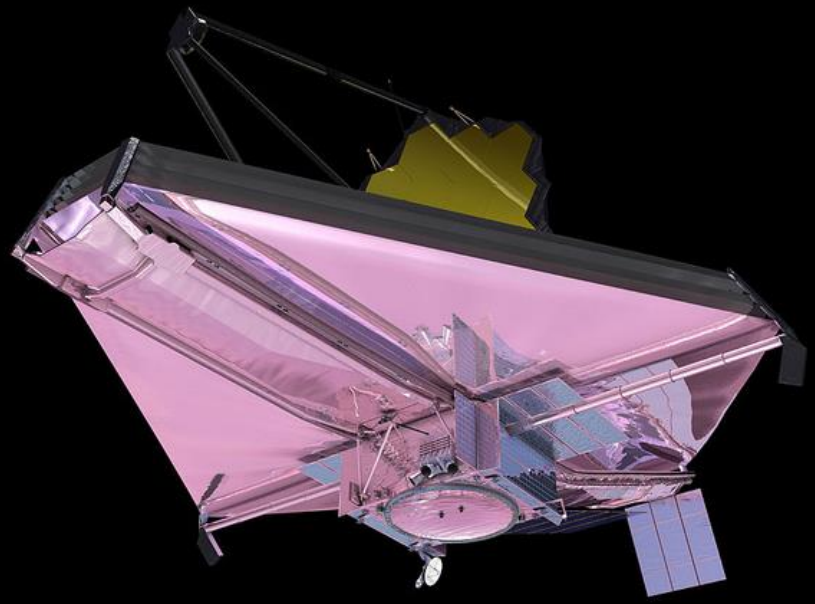

OTE Structure

Spacecraft Structure

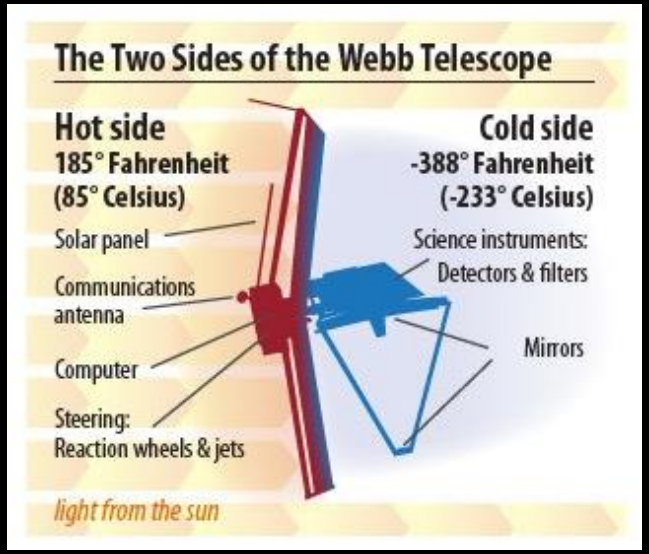

The JWST's 5 layer sunshield has an SPF of ~10^6

Sunshield Facts

- Measures 73 x 40 feet and has 5 layers
- Made of heat-resistant Kapton coated with silicon on sun side and aluminum on other surfaces
- Sun side reaches 358 K (85^o C), dark side stays at 40 K (-233^o C)
- Each of 5 layers consist of 50 pieces to form shape
- Seaming involves 7,000 inches of thermal welds
- Seam-to-seam accuracy ~ 0.05 inch with shape of (tennis court size) layers accurate to a few tenths of an inch

Sunshield Manual Deployment Test: June 2014

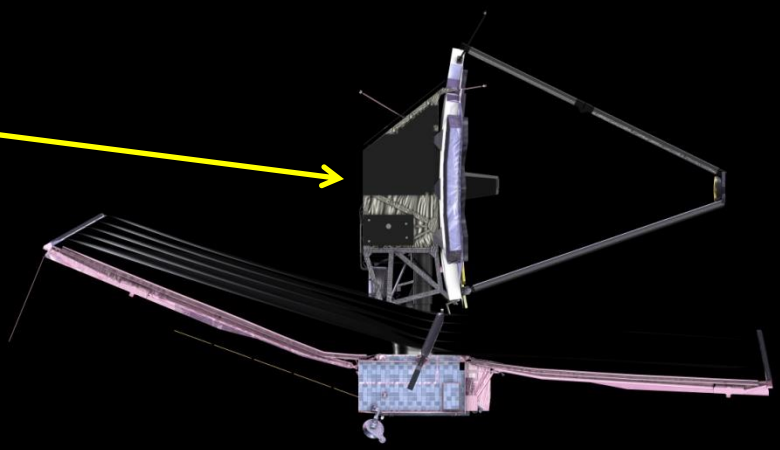

The JWST space vehicle consists of three elements

Optical Telescope Element (OTE)
Collects star light from distant objects

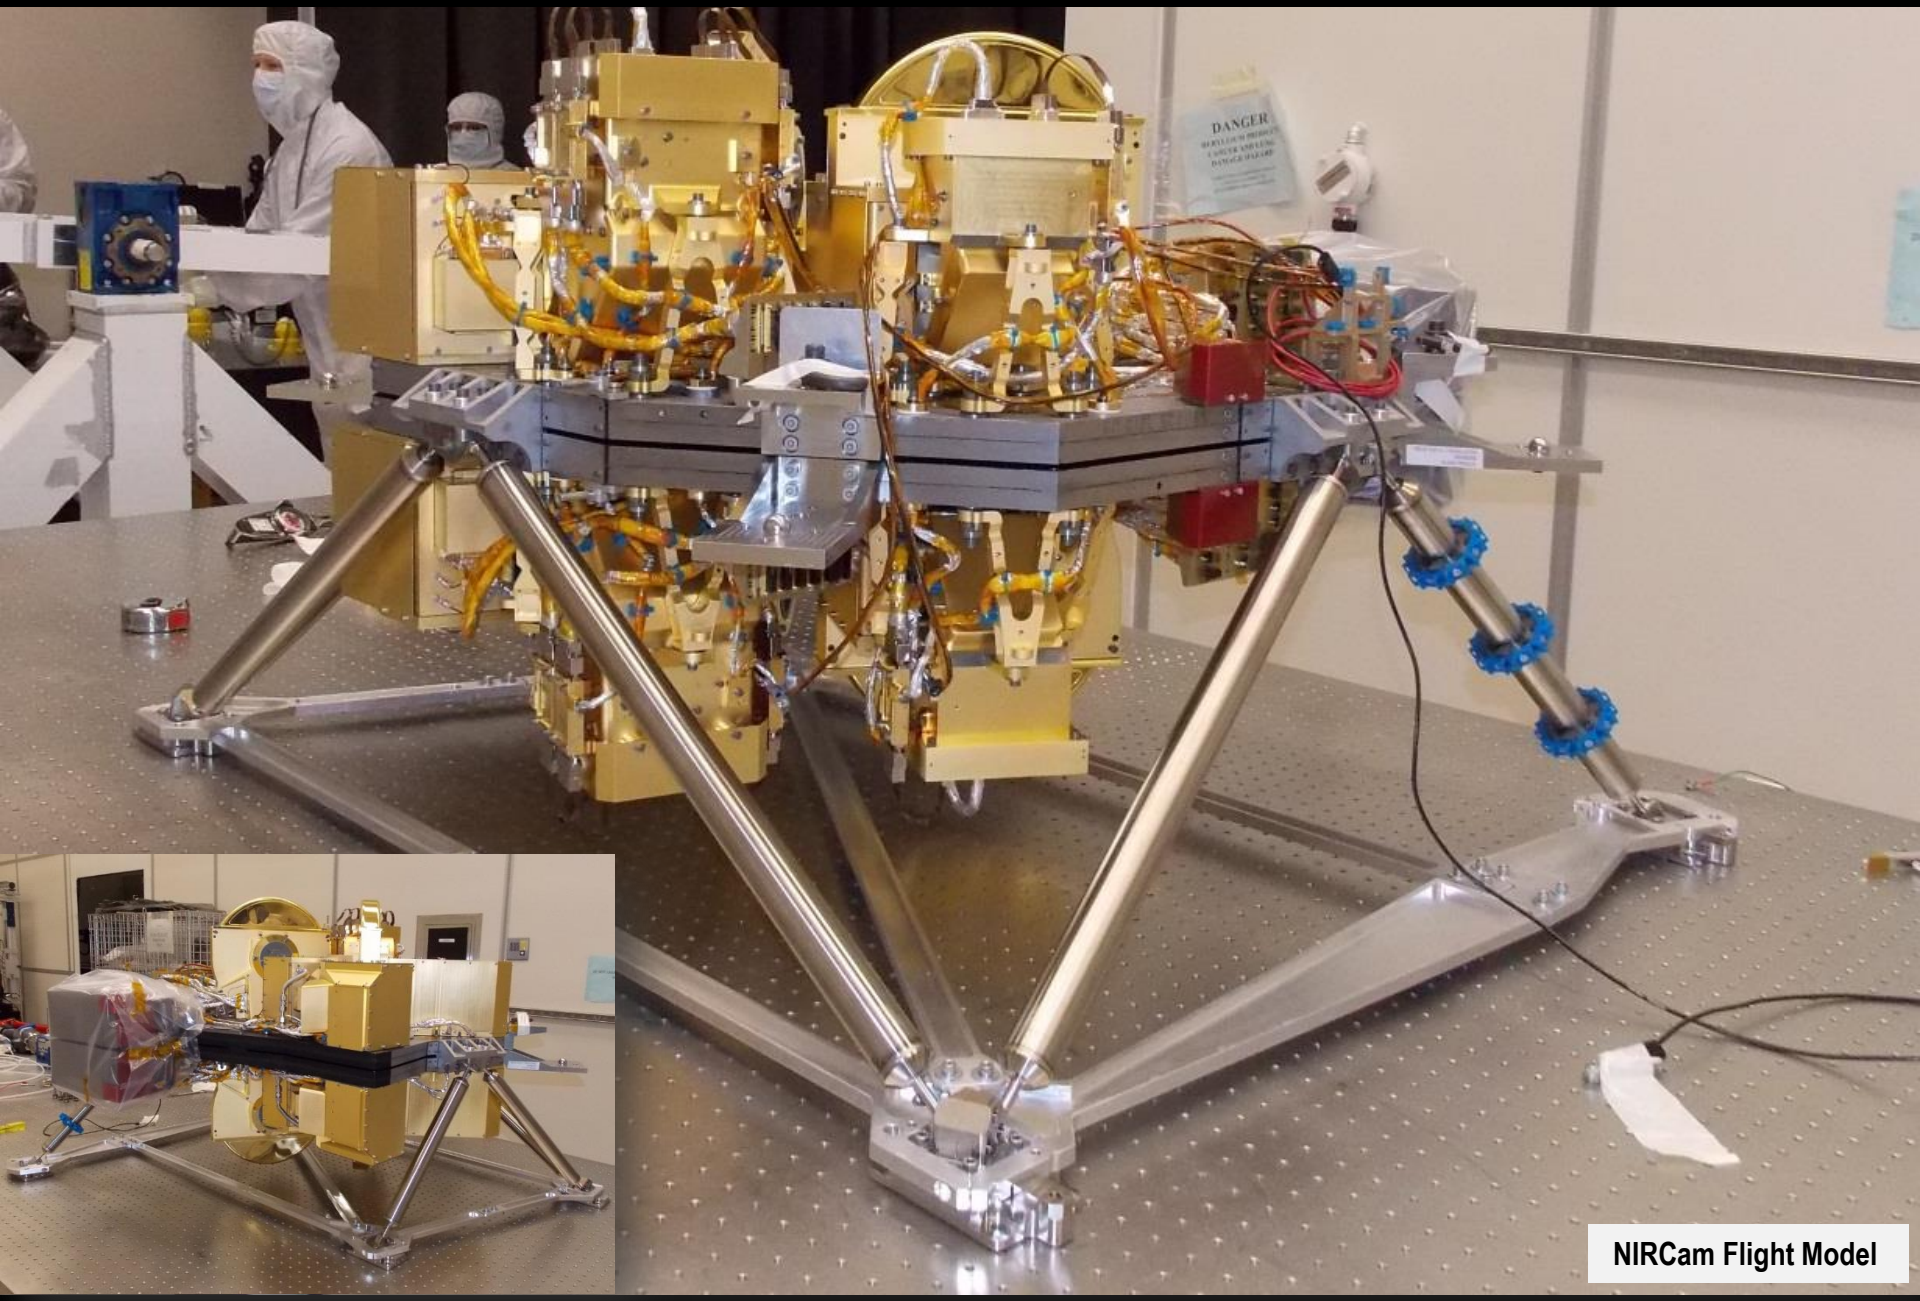

Integrated Science Instrument Module (ISIM)
Extracts physics information from star light

Spacecraft
Attitude control, telecom, power & other systems

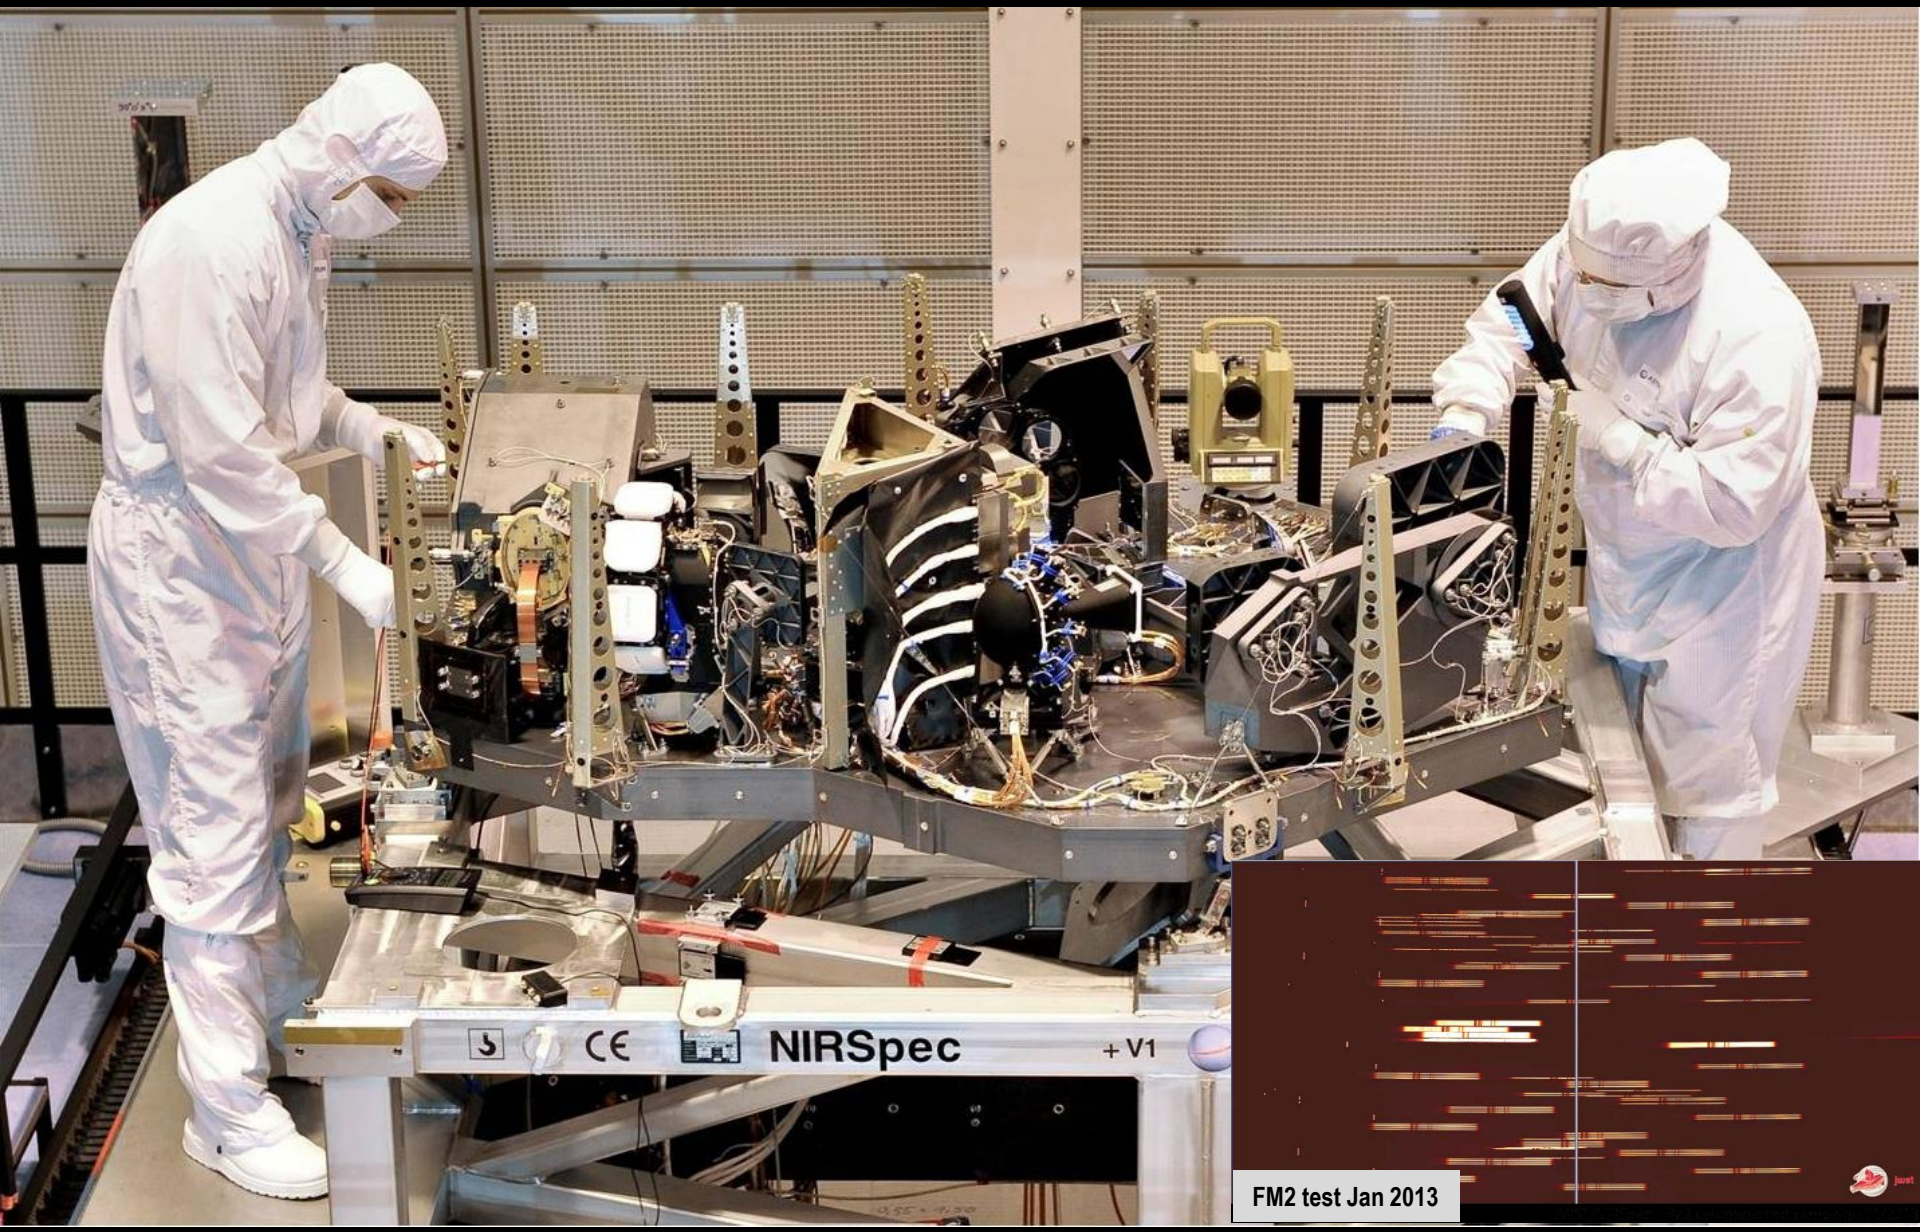

The NIRCam will image the earliest epoch of galaxy formation

NIRCam Flight Model

NIRSpec can obtain spectra of 100 compact galaxies simultaneously

MIRI will provide humanity's first high definition view of the mid-infrared universe

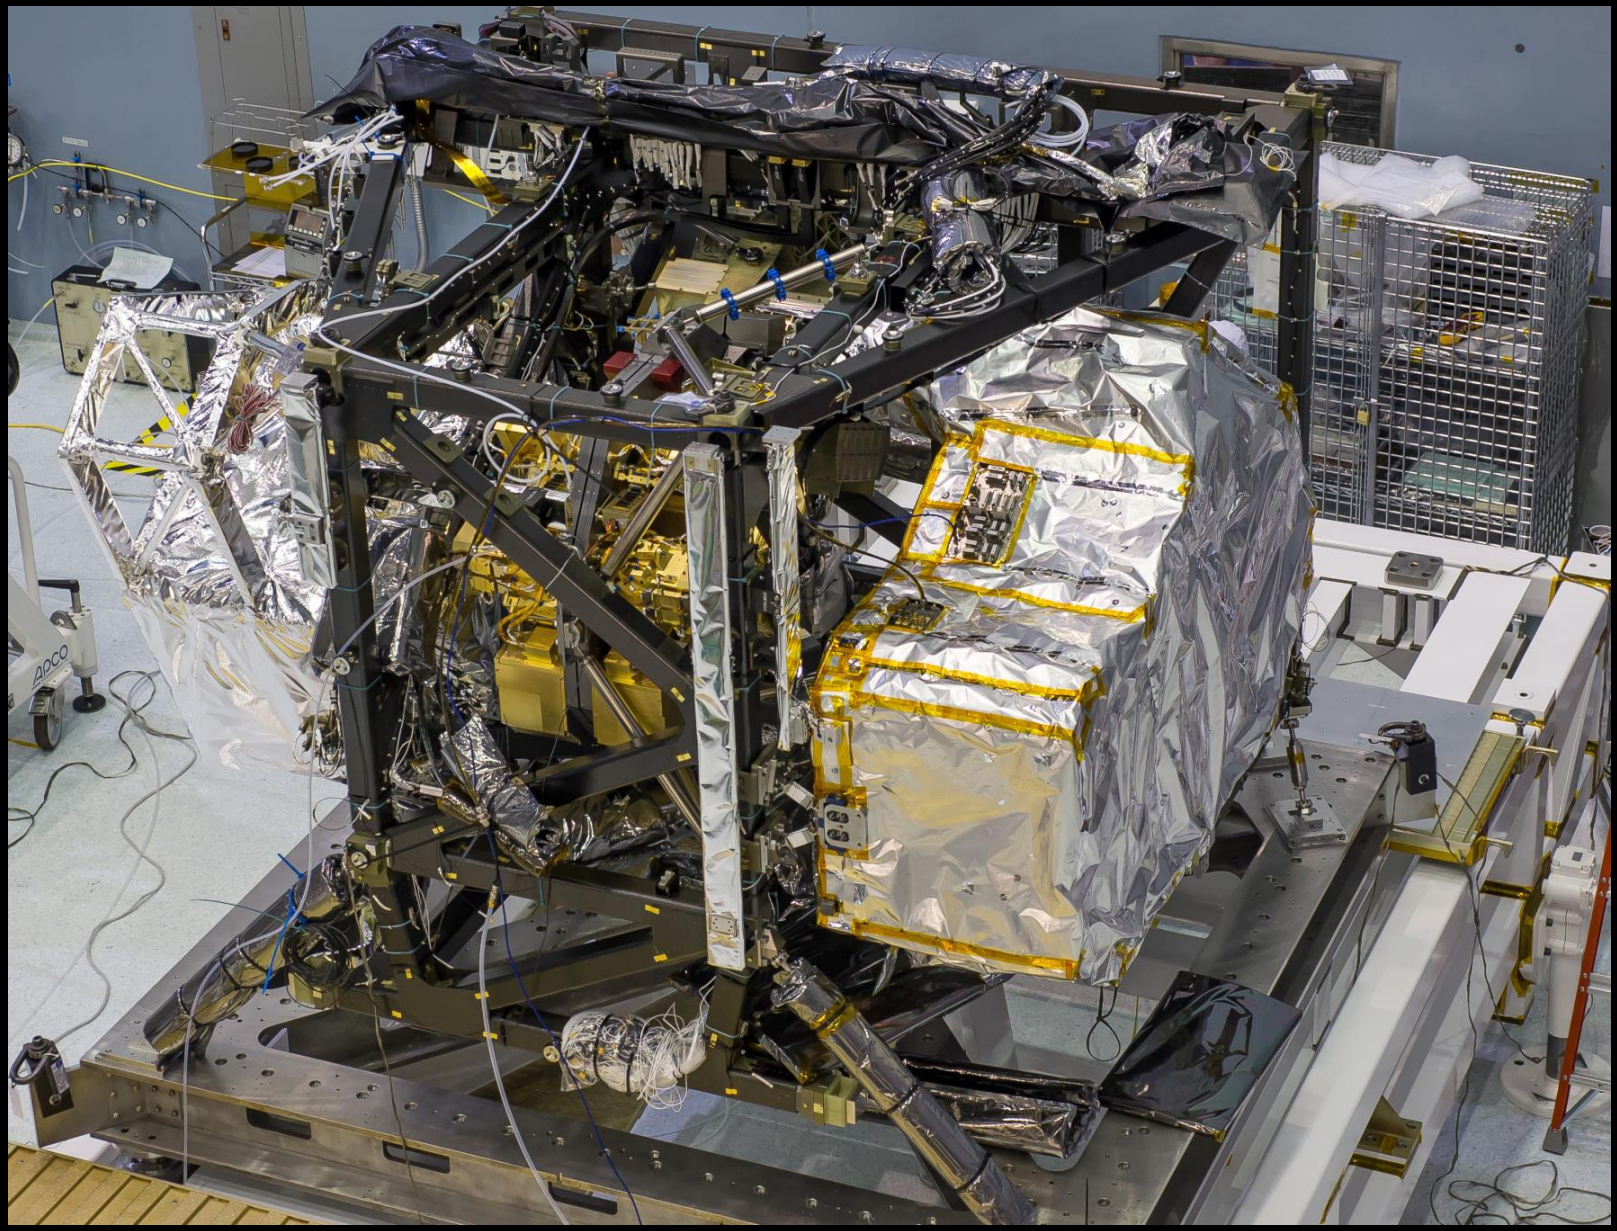

MIRI flight model

FGS can sense pointing to 1 millionth degree precision
NIRISS can image exoplanets that are too close to their star for coronagraphs

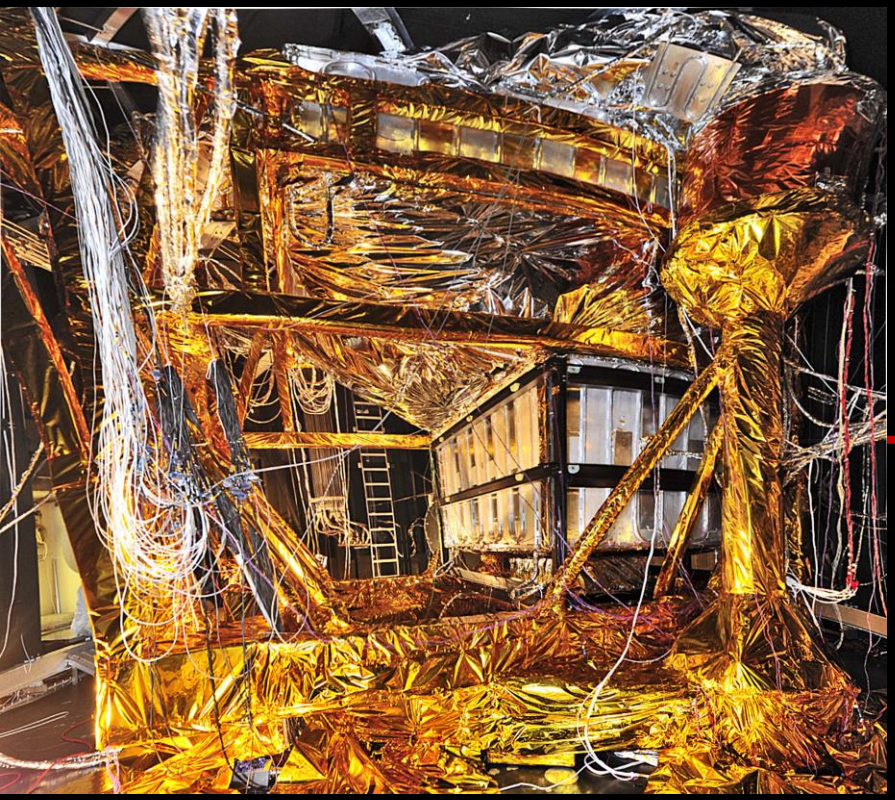

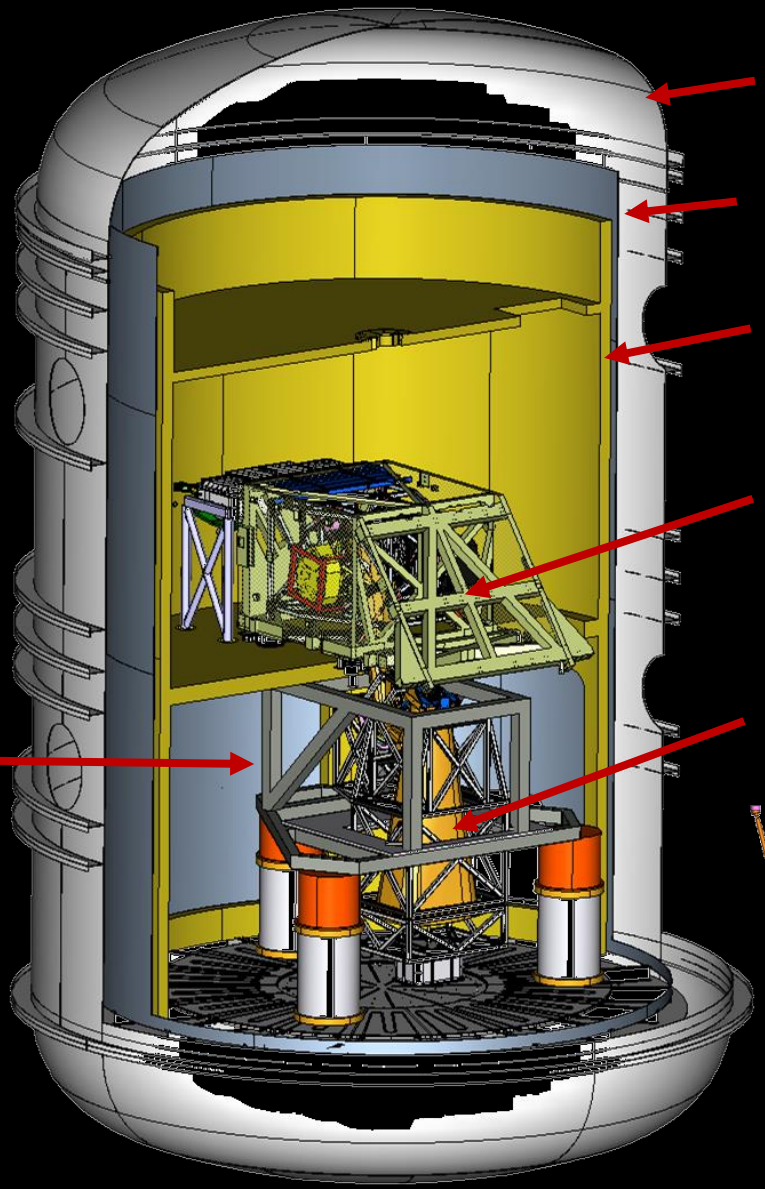

The JWST science instrument payload began construction during 2006 and is now in the final stage of testing ahead of integration with the telescope

ISIM is tested in the Goddard Space Environment Simulator (SES) chamber using a cryogenic telescope simulator (OSIM)

The 3rd of 3 SES test cycles of the ISIM Will begin during November 2015

The telescope and instrument module will be integrated to each other at GSFC and will then be sent to Johnson Space Flight Center during 2016

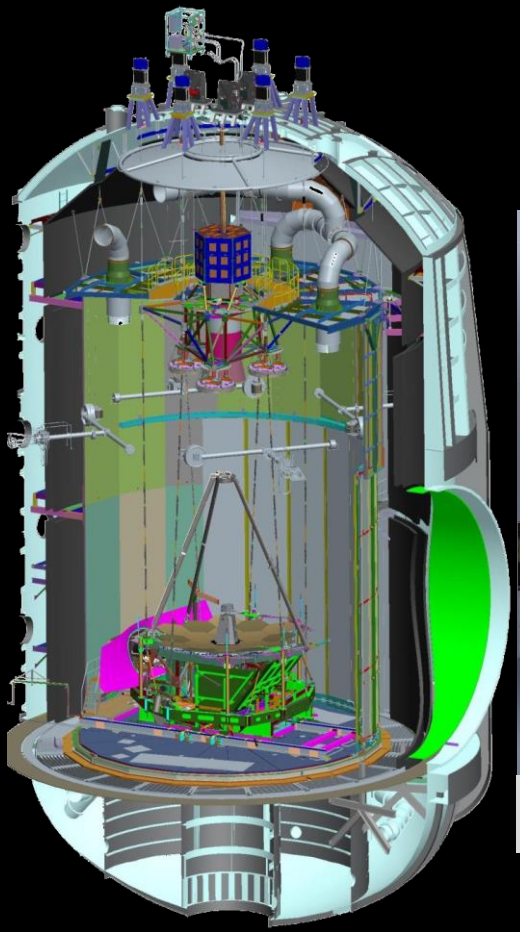

STTARS being loaded into a C5 aircraft

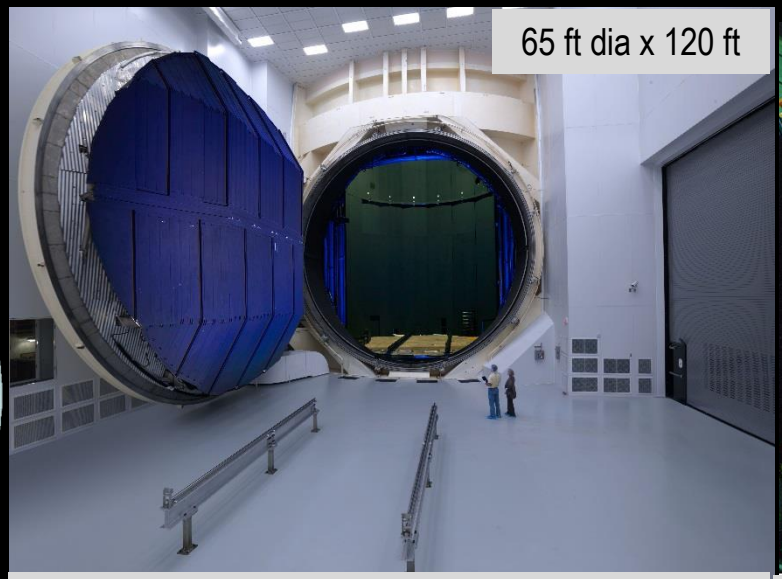

Space Telescope Transporter for Air Road and Sea (STTARS)

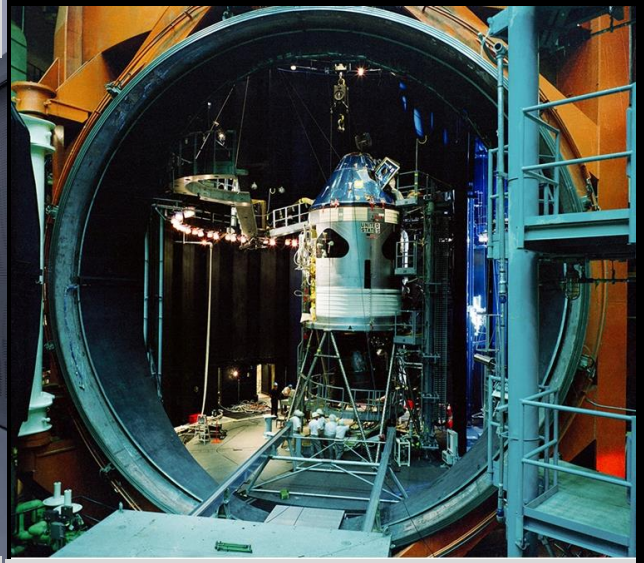

Then …. the OTE + ISIM will be tested in the largest space simulation chamber in the world

- Apollo era facility extensively refurbished for JWST
- Largest deep cryogenic space simulation chamber in the world
- Performance certification completed during Aug 2012
- 13 K and 10^{-8} Torr reached during test

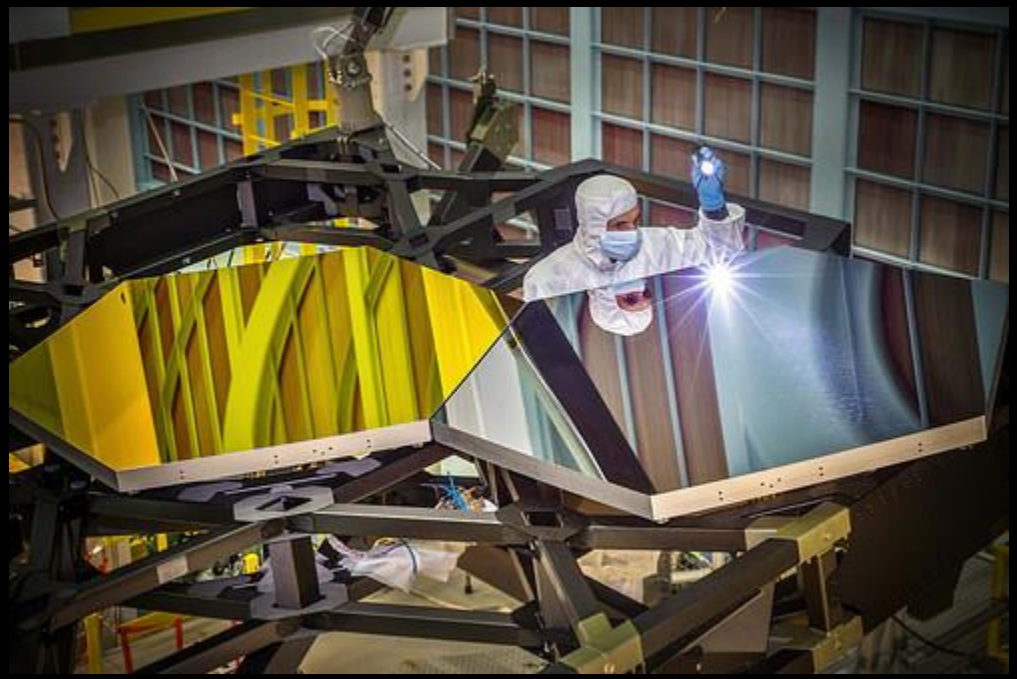

JSC Chamber A today

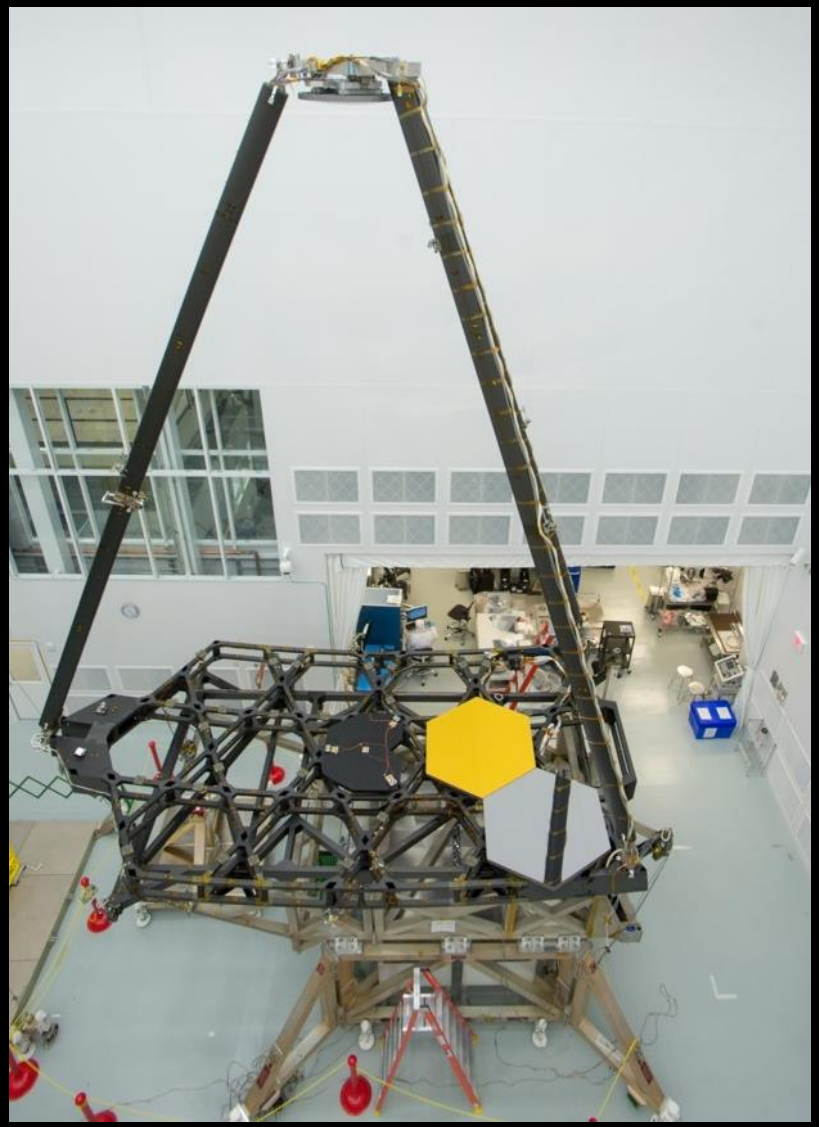

JSC Chamber A during Apollo

The Pathfinder telescope structure began cryogenic testing at Johnson Space Flight Center during May 2015

- The Pathfinder is flight-like in every respect expect:
  - Does not include the deployable “wings” of the backplane
  - Is populated with two flight spare mirror segments

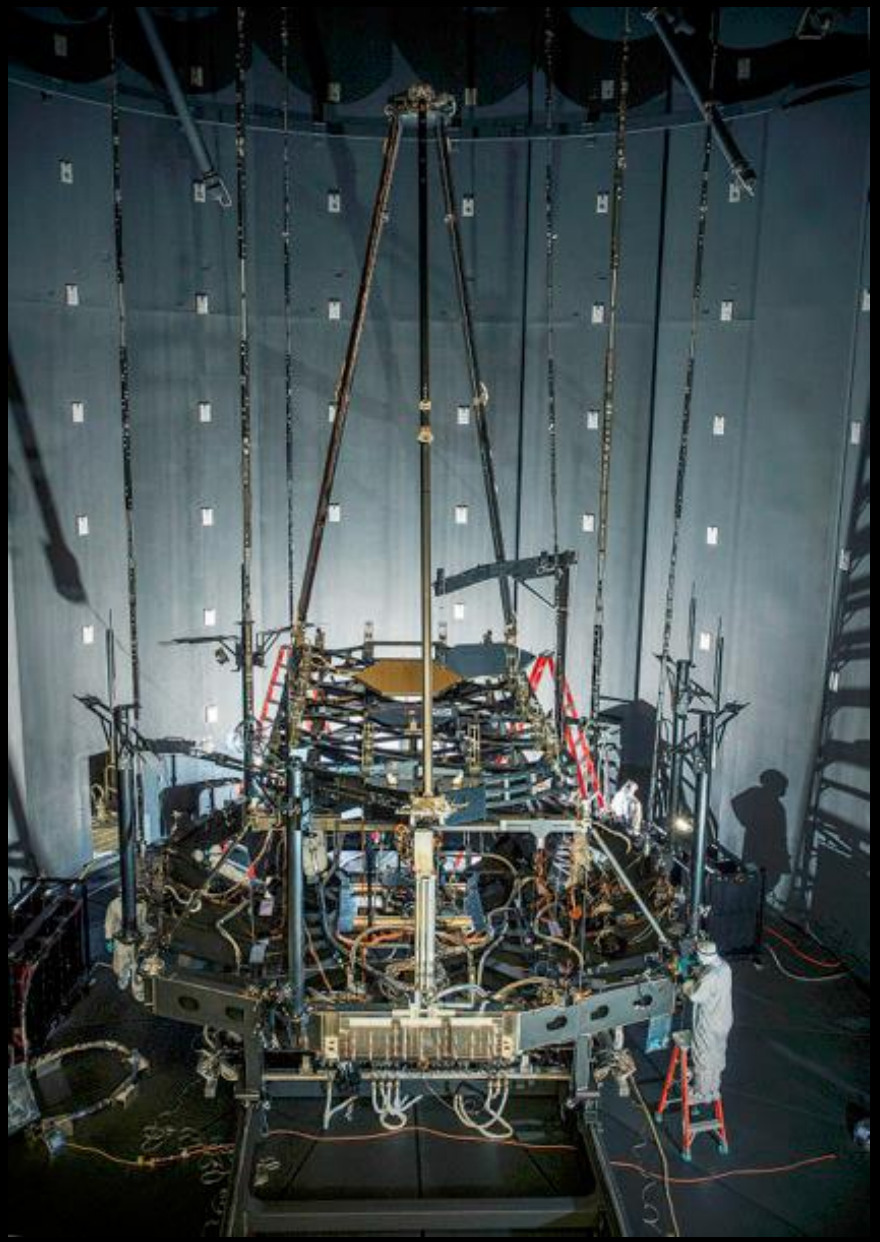

Space simulation testing of the pathfinder telescope structure began during May 2015

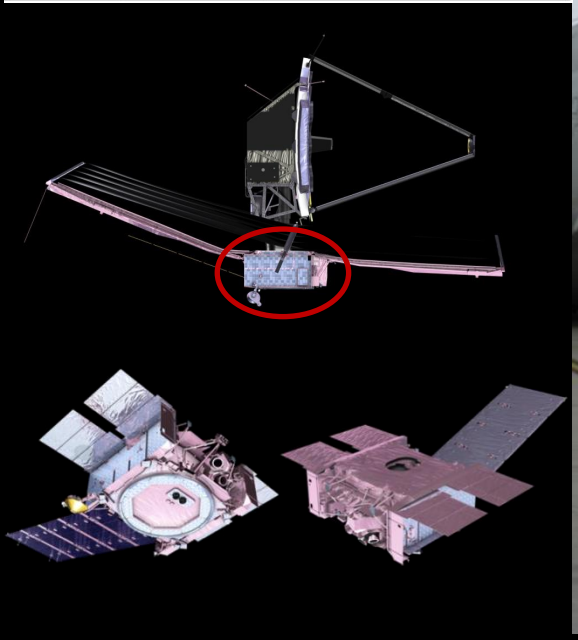

The telescope and instrument module will then be sent to Northrop Grumman Aerospace Systems for integration with the spacecraft bus and sunshield during 2017

Space Telescope Transporter for Air Road and Sea (STTARS)

Then … The JWST will be transported by ship through the Panama Canal to French Guiana for launch during 2018

6900 Nautical Miles
Approximately 20 days

Roll on roll off transport ship built in the Netherlands by Merwede Shipyards
Length 116m
Displacement about 4200 metric tons
Garage deck length 95m (plenty of room for STTARS)
Speed: 15 knots

Space Telescope Transporter for Air Road and Sea (STTARS)

The End (of this presentation)

But

with JWST, we will see the beginning of *everything*

The first galaxies
The origins of galactic structure
The birth of stars
The creation of planets
and more
.
.
.
