Abstract

Climate change and its consequences have become a pressing problem facing the world in several different ways. Over the past 50 years, the world has become increasingly interested in this phenomenon to try to avoid the resulting changes. Examples of these changes include the restructuring of the world's known geography, In addition to the urban areas that are exposed to other images of these changes, and the Delta and the coasts of northern Egypt is one of the most expected areas exposed to environmental and geographical changes, as it is expected to be accompanied by each increase in sea level by half a meter, drowning some entire coastal cities.
