Blockchain as Driving Force for Urban Intrapreneurship after Covid-19: The Emphasize Potential of Iranian Cities

Mohammad Eskandari Sani, Associate Professor of Geography and Urban Planning, University Of Birjand, Iran

Abstract:

Now, Iranian cities are beyond the global average emitting greenhouse gases, energy consumption and etc. Many crises have also caused air pollution, water shortages, poor and sensitive's urban economy, and etc. One way out of these crises is to use the capacity of smart cities and blockchain technology for sustainable development and urban enterpership. The application of information technology is generally considered a key driver in the "smartization" of cities. This research seeks a direct answer to this question How blockchain in the form of smart cities can move Iranian cities towards sustainable development. The results show that in 15 areas, blockchain can help promote sustainable development and entrepreneurship in Iranian cities. Also, High urban growth, Existence of population window, Low wage of skilled labor, high level of university literacy and graduates, large number of freelancers, more than 10 metropolis and Tehran as capital more than 12 million population, expensive living, high cost of services, High interest rates on money, low value of Rials compared to other valid currencies are some of advantages of Iranian cities for application of Blockchain.
