Abstract

•Emphysema: The word it's self define its meaning i.e., inflation or full of air, Which is an abnormal distension of the bronchioles or alveolar sac in the lungs due to which Respiratory surface is decreased .

• one of the major cause of this is; cigarette smoking, therefore one must be avoided such harmful uses of air pollutants . Thus, smoking converted the "ciliated columnar cells" into "Stratified squamous epithelium ".

I believe prevention is better then cure taking some initial step and quit to harmful/bad habits can save us from huge disaster which we never ever imagined. Say "No to smoking "
